

Microsoft 365 Copilot Analytics

Multi-Agency Reporting Pattern Decision

Evaluate two author-created patterns for a shared tenant

THIS GUIDE'S AUTHOR-CREATED ARCHITECTURE PATTERNS

Default Priority and **Restricted Reporting** (formerly labelled "Isolation" and retained in existing URLs) are names created by this guide. They are not Microsoft product, security, compliance, or licensing terms. Microsoft documents the component controls; it does not document either combination as an end-to-end security boundary.

This guide offers two reporting patterns for a shared Microsoft 365 tenant: **Default Priority** makes an agency group the leader's expected starting scope while accepting broader access; **Restricted Reporting** combines partition-scoped analyst queries with separate controls for Dashboard, Agent, export, delegation, managers, privileged actors, and Power BI. Neither pattern creates cryptographic, tenant, or independently certified security isolation.

Supported Environment and Licensing Gate

Check the exact cloud, assigned service plans, tenant UI, Message Center, and every required surface before choosing a path. Microsoft's current Supported environments matrix lists availability feature by feature for GCC Moderate (GCC-M) and GCC High (GCC-H). The Agent Dashboard, Copilot Dashboard metric export, the Consumption Dashboard and the Copilot Dashboard Readiness page are not available in either. Delegate access to dashboards is not available in GCC-M and is partial in GCC-H. Of the Copilot Power BI templates, only the Copilot business impact report is supported (GCC-M: yes; GCC-H: partial). Check the matrix for each feature before planning a government-cloud rollout. Microsoft's feature access management article states that its access controls aren't available in GCC High or DoD. For GCC, check the documentation for the specific app. The Agent Dashboard is preview and unavailable in national/regional clouds. For advanced access, Microsoft Learn describes the 50-plan threshold differently: the environment article explicitly gives **30 Copilot + 20 Viva Insights** as 50 qualifying Viva Insights service plans, while the Dashboard article describes 50 Copilot or 50 Viva Insights. Do not claim mixed licences fail. For Agent Dashboard, use the conservative feature-specific prerequisite of 50 Microsoft Copilot licences plus agent activity and validate in the tenant. Escalate a documented mismatch to Microsoft Support.

Risk checkpoint	Decision implication
Shared executive or cross-agency manager hierarchy	Their manager scope can span agencies. Restricted Reporting requires an explicit exception decision or removal from agency-facing surfaces.
Global Administrator, globally assigned user, global-partition analyst, or multi-partition analyst	Tenant-wide or multi-agency visibility can remain by design. Record least-privilege justification and conflict-of-interest review.
Delegate, Agent Dashboard, Consumption Dashboard (including identified outputs), or metrics export	Partitions do not scope these surfaces. Apply and test each separate access control, including the separate Identification policy for named-employee outputs.
Power BI viewer, Member/Contributor, export, Build, Analyze in Excel, or resharing	Power BI permissions are independent of Viva partitions. Design and negatively test the delivery boundary separately.

Question 1 — Is broader cross-agency reporting access acceptable?

Yes — broader cross-agency reporting access is acceptable

No — evaluate defense-in-depth reporting segmentation

If the requirement is cryptographic, tenant, sovereign, or certified security isolation, stop: this tool cannot establish that boundary. Obtain a security architecture assessment before selecting a shared-tenant pattern.
