

Microsoft 365 Copilot Analytics

Cowork Dashboard Operations

Read Cowork adoption, value, and credit use, and reconcile the numbers across the admin center and Viva Insights

Document Property	Value
Section	Operate
Audience	Microsoft 365 administrators, FinOps, Insights Analysts, Managers, Microsoft 365 Global Administrators
Version	1.1
Last validated	8 October 2026
Source snapshot	Microsoft Learn pages last updated between 2 July 2026 and 7 October 2026, plus Microsoft’s Cowork methodology PDF

Operational views, not the bill

Use these dashboards to track adoption, value, and spend trends. Reconcile charges against the monthly billing record (**Billing > Bills & payments** in the Microsoft 365 admin center), never against a dashboard. Report Cowork assisted hours as a directional estimate only, not as time saved, a productivity gain, a business outcome, or realised value.

1. Which Dashboard Answers Which Question

Cowork reporting is split across two products. The Microsoft 365 admin center covers adoption, access, and value. The Viva Insights Consumption Dashboard covers credit consumption by organisation, group, and job function. Start from the question you need to answer.

Question	Where to look	Notes
How many people use Cowork, how often, and do they come back?	Admin center: Copilot > Cowork > Usage	Defaults to the past 28 days. Each card shows a week-over-week trend.
Who is using it, and how much?	Admin center: Cowork usage details table on the Usage tab	One row per user with activity since 1 April 2026. Exports to CSV.
What work does Cowork do, and how many hours did it assist?	Admin center: Copilot > Cowork > Value	Frontier preview. Assisted hours are directional (Section 5).
Who is waiting for access, and is a billing grace period running?	Admin center: Copilot > Cowork > Overview	Also links to Cowork plugin management.
How many credits does Cowork consume, and which groups drive it?	Viva Insights: Consumption Dashboard > Microsoft 365 services > Cowork (Deep dive)	Month to date, filtered by Scope, Organization, and Job function. The services page currently covers only Cowork and the Work IQ API.
Can I query Cowork data in Advanced analysis?	Advanced analysis consumption query	Returns four preselected metrics (Total Copilot Credits used, Session count, User limit, and Spending policy limit) and excludes GitHub data. Every Cowork metric in the metrics reference, including tasks, task categories, and assisted hours, is listed for the Consumption Dashboard only, so don't plan queries around them.

Only the Value tab is labelled preview. Microsoft's articles don't label the other admin center tabs or the Consumption Dashboard's Cowork page as preview.

Don't use the Agent Dashboard for Cowork. Microsoft is moving Cowork usage data out of it into other Viva Insights reports and points to the admin center in the meantime.

2. Access and Scope

Two separate controls apply. Spending policies decide who can use Cowork. Reporting roles decide who can see the dashboards.

Spending policies grant Cowork access

Anyone in scope of a spending policy that includes Cowork can use it, whatever the policy’s credit limit. The Cowork entry under **Agents > All Agents** doesn’t control access. The default first-time usage-based billing setup targets your whole organisation, so decide who should get Cowork before you complete it. For a pilot, select **Customize setup configuration** during setup to limit the default policy to specific groups.

Admin center reporting roles

To read the Cowork dashboard, use a role that can view Microsoft 365 usage reports. For read-only access, assign **Reports Reader**. AI Administrator, Global Administrator, Exchange Administrator, SharePoint Administrator, Teams Administrator, and Teams Communications Administrator can also view it. Usage Summary Reports Reader and User Experience Success Manager are limited to reports without user details, so check what they see in the Cowork table before you rely on them. Global Reader isn’t on Microsoft’s usage-report role list, so don’t assume it works.

The Cowork article doesn’t document separate role requirements for the **Value** or **Settings** tabs, so test each tab with the account you plan to use.

Cowork administration task	Role
Set up usage-based billing and billing methods	Global Administrator or Billing Administrator
Edit spending policies, limits, alerts, and billing methods (but not create policies)	AI Administrator. Microsoft’s documentation is inconsistent about License Administrator; test it before you rely on it (Section 9).
Manage Cowork plugins (Overview > Manage plugins for Cowork > Go to Tools)	A tenant administrator or the Copilot administrator role
Turn on Frontier for users (the Value tab is a Frontier preview feature)	AI Administrator, Security Administrator, or Office Apps Administrator

Consumption Dashboard roles

Role	What they see
Insights Analyst with global partition access	The whole organisation. Can also run consumption queries in Advanced analysis (GitHub data excluded).
Manager	Their own group, once Manager settings allow it. The manager also needs Copilot insights access and a team that meets the minimum team size, which can't be set below five. Microsoft's sources describe this threshold differently (Section 9).
Microsoft 365 Global Administrator	The whole organisation.

- Analysts assigned to any other partition can't open the dashboard or run consumption queries.
- Removing an analyst from the global partition removes all of their global-partition access, not just this dashboard.
- Check Manager settings before you assume managers have consumption insights. Microsoft's documentation is inconsistent on the default (Section 9).

Check delegation before you share access

Microsoft's documentation is inconsistent on whether Consumption Dashboard access can be delegated. How to use the Consumption Dashboard says it can't; Delegate access describes a **Combined access** scope that includes it. Test with a pilot delegate before you rely on either. Also review existing delegates: when a delegator has both company and group access, their **Your company** delegates move to Combined access automatically and might now see the Consumption Dashboard.

Named users and privacy

Copilot Analytics outputs, including the Consumption Dashboard, are de-identified by default. **Identification** lets authorised users see named employees in Consumption Dashboard insights and exports. It's granted through its own Viva feature access management policy, which only a Global Administrator or AI Administrator can create. When identifiable export is on for a user, their exports include identifiable fields; otherwise identifiers are replaced with anonymised IDs. Identification is also listed for Copilot Dashboard data export (private preview) and Agent Dashboard data export, whose preview status Microsoft's articles disagree on (Section 9).

The admin center report works differently. Its usage details table defines **User ID** as the user's email address. Microsoft 365 usage reports hide user names by default through the Conceal user, group, and site names in all reports setting, but Microsoft doesn't document how that setting, or the Identification policy, applies to the Cowork table and its export. Check both with the role you intend to use, and treat the output as personal data until you've confirmed what it contains.

3. Before You Start

Confirm these checks before you interpret any figure.

Check	Expected state	Owner
Cowork licences	People who use Cowork have a Microsoft 365 Copilot licence. Microsoft doesn't document a licence requirement for report viewers, whose reporting access follows the roles in Section 2. Cowork has been generally available since June 2026.	Microsoft 365 administrator
Usage-based billing	Enabled under Copilot > Cost Management > Get Started . Users need it to access Cowork.	Global Administrator or Billing Administrator
Spending policies	Every intended Cowork user, and nobody else, is in scope of a policy that includes Cowork. Review the policies under Copilot > Cost management > Configuration .	Global Administrator or Billing Administrator
Grace period	If the Overview tab shows a Grace period card, it counts down the days left before you must act to keep Cowork access. Set up consumptive billing before the date it shows.	Billing Administrator

Frontier (Value tab only)

The Value tab is a Frontier preview feature. Frontier is turned on under **Copilot > Settings > Copilot Frontier** (set to **No access** by default), Frontier features might take three hours to reach users, and users need a Microsoft Copilot licence for Copilot-related Frontier features. Microsoft doesn't document which enrolment the Value tab needs, so check it with the account you plan to use.

AI, Security, or Office Apps Administrator

Government and national clouds

Microsoft's availability matrices show Cowork reporting in the worldwide commercial cloud only. The admin center report matrix lists the Cowork usage report as N/A in GCC, GCC High, DoD, and 21Vianet: the service isn't available there, so there's no plan to release the report. The Viva Insights Supported environments matrix lists the Consumption Dashboard as unavailable in GCC Moderate and GCC High. Cowork's own documentation doesn't state national-cloud availability, and the matrices can lag new releases, so confirm in the tenant and Message Center before you commit to anything.

4. Operating the Dashboards

Tasks 1–3 use the Microsoft 365 admin center. Task 4 uses Viva Insights.

Task 1 — Open the Cowork dashboard

- 1 Sign in to the Microsoft 365 admin center with a reporting role from Section 2.
- 2 In the left navigation, select **Copilot**.
- 3 Under **Copilot**, select **Cowork**.
- 4 Note the **Last updated** timestamp in the upper-right corner. It shows when the data was last refreshed; record it with every figure you take.

Verify: the dashboard opens and shows a **Last updated** timestamp.

Task 2 — Read the Overview and Usage tabs

- 1 On **Overview**, read **Active Cowork users** and **Total Cowork tasks**. If a grace-period banner appears, note the date on the **Grace period** card.
- 2 Under **Top actions for you**, review **Pending requests for Cowork**.
- 3 Select **Usage** and set the **Date range selector**.
- 4 Read the four cards: **Active Cowork users**, **Total Cowork tasks**, **Average tasks**, and **Retained Cowork users**.
- 5 Review the **Daily active users** and **Tasks by type** charts. Tasks by type splits user-initiated tasks from scheduled ones.
- 6 Review the **Cowork usage details** table for user-level activity.

Verify: when you change the date range, the cards, charts, and table all update.

A **task** is one conversation thread, whether a user started it or Cowork ran it on a schedule. Follow-up questions in the same thread don't create a new task. Watch the ratio of **Retained Cowork users** (active in both of the last two seven-day periods) to **Active Cowork users**: a high ratio means people keep coming back.

Task 3 — Review the Value tab (Frontier preview)

The Value tab is a Frontier preview feature (Section 3). Read Section 5 before you quote any figure.

- 1 In **Copilot > Cowork**, select the **Value** tab.
- 2 Set the **Date range** to **Last 28 days** or **Month to date**. Both run to the latest available data refresh.
- 3 Read the **Cowork assisted hours** card.
- 4 Review **Assisted hours by task category**, which shows users, assisted hours, and credits spent for each category.

Verify: the card and table reflect the range you chose. If the tab is missing, check the Frontier setup in Section 3 and test with another eligible account; Microsoft doesn't document exactly when the tab appears.

Task 4 — Read the Cowork page in the Consumption Dashboard

The Consumption Dashboard is on by default but needs usage-based billing set up through Cost Management in the Microsoft 365 admin center.

- 1 Open the **Consumption Dashboard** in the Viva Insights web app.
- 2 On the **Microsoft 365 services** tab, set **Scope**, **Organization**, and **Job function**. The time period is month to date.
- 3 Select **Deep dive** next to **Cowork**.
- 4 Read the cards: **Cowork active users**, **Cowork Credit usage**, and **Average tasks per user**.
- 5 Use **Cowork usage trends** to see how credits and activity change over time by group, organisation, job function, or policy.
- 6 Use **Cowork usage breakdown by task** to see which task categories consume the most.
- 7 Switch **Metric** between credits used and task count.
- 8 Review **Usage intensity** to see whether consumption is concentrated in a few users. It's similar to the usage intensity view on the Microsoft 365 services page.

A high share of scheduled tasks in the breakdown can indicate that people are automating repeatable work.

Verify: the cards show month-to-date values and change when you change **Scope**, **Organization**, or **Job function**. For metric definitions, see Copilot Cowork metrics.

5. Reading Assisted Hours

Treat Cowork assisted hours as a directional estimate of the work Cowork supported. Never present it as time saved, a productivity gain, a business outcome, or money. The same caution applies to any assisted value shown on the Consumption Dashboard's Cowork page.

- **How it's calculated.** Each task is matched to a type of work and assigned a typical time impact, informed by independent published research and observed usage patterns. The Cowork methodology (PDF) groups tasks into eight categories, each with a minutes-saved range traceable to a published study. Actual impact varies with the work and how people use Cowork.
- **It isn't the Copilot Dashboard metric.** Copilot Dashboard Assisted Hours applies research-based multipliers to Copilot actions, and Assisted Value applies an hourly rate (\$72 by default). Cowork has no documented rate or currency. Don't add, compare, or trend the two. The Dashboard Guide covers the Copilot Dashboard metrics.
- **Category names differ between Microsoft pages.** The metrics reference lists a **Document & comment task** category; the Value tab and the methodology call it document and content creation. Map the labels before you compare reports (Section 9).
- **Don't quote the methodology's minute values.** Its cover is labelled v4 but its page footers say v3 (additive), and the aggregation formula and the handling of unclassified tasks aren't documented.

When you report assisted hours:

1. Call it a directional estimate of work Cowork supported.
2. Show it by task category, next to **Credits spent** for the same category and period.
3. State the surface, date range, Frontier status, and methodology link with every figure.
4. Don't convert it to money.

6. Export and Reconciliation

Export from the admin center

- 1 On the **Usage** tab, select **Export** above the **Cowork usage details** table.
- 2 Save the CSV file. It includes every user in the table, with activity since 1 April 2026.

Verify: the number of rows matches the item count in the table header.

The file can identify users by email address (Section 2), so store it as personal data. Microsoft doesn't document the CSV headers, encoding, or row limits.

Export from the Consumption Dashboard (public preview)

This export is a public-preview feature. Where it's available, global-partition Insights Analysts and Global Administrators can use it, so confirm that the download button appears before you plan around it. The export involves personal data and excludes GitHub metrics. Whether managers can export is unresolved (Section 9).

Option	Covers	Typical freshness
Export by week	The previous five months plus month to date	2–8 days behind
Export by day	The start of the previous month to the export date	Up to two days behind

Both options include complete days or weeks only; an incomplete period is left out. Each download is a ZIP file with two CSV files that join on `PeopleHistoricalId`. `PersonServiceCreditsMetrics.csv` has one row per person, service, and date, with sessions and credits (for example `SessionCount` and `TotalCreditsUsed`). It doesn't include Cowork tasks, task categories, or assisted hours. Identifiers are hashed unless identifiable export is enabled for you.

- 1 At the top right of the Consumption Dashboard, select the **download** button.
- 2 Select **Export by week** or **Export by day**.
- 3 Join the two CSV files on `PeopleHistoricalId` only.
- 4 Check the `ServiceName` values in your file and keep the Cowork rows. The export article's example values are Copilot Cowork, WorkIQ, Researcher, BizChat, Deepwork, Outlook, and WXP, although the dashboard reports only Cowork and the Work IQ API.

Verify: the ZIP contains two CSV files that join cleanly on `PeopleHistoricalId` and include only complete days or weeks. Record the latest date in the file, because recent periods can be missing while they're incomplete. Store the files under access controls suitable for personal data.

Reconcile the figures

Expect the numbers to differ. Tasks, credit sessions, and credits count different things, and the two products scope and time their data differently:

- **Tasks and sessions.** The Consumption Dashboard article says several tasks, especially scheduled ones, can map to one billed session; the metrics reference defines a session as a task or conversation, including scheduled tasks. Treat the mapping as unresolved (Section 9).
- **Scope.** Viva Insights follows Scope, Organization, and Job function; the admin center lists individual users. Microsoft documents a minimum group size for the Copilot and Agent Dashboards but doesn't say whether the Consumption Dashboard suppresses small groups, so check in your tenant.
- **Active users.** The admin center counts anyone who prompted a Cowork task or had a scheduled task run for them. On the Consumption Dashboard, compare against the Cowork page's **Cowork active users** (people who used Cowork at least once in the period), not the services page's **Active users** card, which also counts Work IQ API activity.
- **Time window.** The Usage tab defaults to the past 28 days; the Consumption Dashboard shows month to date.

- 1 Record the surface, tab, date range, scope, and filters with every figure.
- 2 Compare like with like: admin center tasks with admin center tasks, and Consumption Dashboard credits with **Copilot > Cost management** credits for the same policy and period. Never compare task counts with session counts.
- 3 Reconcile money only against the monthly billing record. **Billing > Bills & payments** in the Microsoft 365 admin center shows invoices and a high-level snapshot of charges; for detailed analysis by subscription, resource, meter, or invoice period, use Azure Cost Management.
- 4 Log any difference you can't explain rather than forcing the totals to match.

Verify: every difference has a stated cause or is logged.

7. Success Criteria

Before you rely on a recurring Cowork review, confirm that:

- Each reviewer sees only the surfaces and scopes their role allows, and managers can't switch to Company scope.
- The spending policies that include Cowork cover exactly the people you intend.
- The admin center tabs show a **Last updated** timestamp, and changing the date range updates every card, chart, and table.
- The Value tab is visible after Frontier enrolment, or its absence is recorded, and every assisted-hours figure carries its date range, surface, and caveat.
- The Consumption Dashboard Cowork page responds to the Scope, Organization, and Job function filters.
- Exports are stored under personal-data access controls, and money is reconciled against the billing record.
- Nobody has promised availability in GCC or any other national cloud.

8. Troubleshooting and Escalation

Symptom	Likely cause	Fix
Someone can use Cowork who shouldn't	They're in scope of at least one spending policy that includes Cowork. A more restrictive policy doesn't override a more permissive one.	Find every policy that includes Cowork and remove them from its scope.
A low credit limit doesn't stop a user	Limits are a spending safeguard, not an access control. A one-credit limit still grants access, and because limits are enforced asynchronously, a user might start one or more tasks after reaching the limit. A running task can also finish after the limit is reached.	Control access through policy scope, and expect some use after a limit is reached.
You need to block specific users	Microsoft's articles give different routes: Cowork common questions says to add users to a security group excluded from the Copilot experience; Cowork access controls says to leave them out of every policy that includes Cowork.	Test your chosen route on a pilot user, confirm they're out of every policy that includes Cowork, and record what worked (Section 9).
Users can request Cowork but can't use it	Cowork is discoverable but usage-based billing isn't set up, so users can request access in the app.	Review Pending requests for Cowork on the Overview tab, then set up consumptive billing to grant access to approved users.
The Value tab is missing	The Value tab is a Frontier preview feature, and Microsoft doesn't document which enrolment it needs or exactly when it appears.	Check Frontier under Copilot > Settings > Copilot Frontier , allow time for Frontier features to reach users (it might take three hours), and test with another eligible account.
The Consumption Dashboard is blank or zero	Usage-based billing isn't set up, there's no Cowork activity this month, or filters exclude everyone.	Confirm billing setup and month-to-date activity, then clear the filters.

The admin center table shows no names

Usage reports conceal user names by default. Microsoft doesn't document exactly how that setting applies to the Cowork table.

Check the **Conceal user, group, and site names in all reports** setting and test the table with the intended role. Change the setting only if your privacy policy allows.

Escalation evidence

Before you escalate, capture the tenant's cloud, the viewer's role, the surface and tab, the date range, scope, and filters, the **Last updated** timestamp, the spending policies that include Cowork (with their scope and limits), the exact error text, and any related Message Center or Service Health notice. Route role and policy issues to the Microsoft 365 administrator who owns Copilot settings, access and Manager settings issues to the **Insights Administrator**, billing differences to the **billing administrator**, and unresolved availability or data questions to **Microsoft Support**.

9. Known Gaps and Conflicts

Microsoft’s documentation is inconsistent or silent on the points below, as of 8 October 2026. Test them in your tenant before you promise any of these behaviours to stakeholders.

Where Microsoft’s documentation conflicts

Topic	The conflict	What to do
Consumption Dashboard delegation	How to use the Consumption Dashboard says access can’t be delegated; Delegate access describes a Combined access scope that includes it.	Test with a pilot delegate and review existing delegates.
Manager default for consumption insights	How to use the Consumption Dashboard says consumption insights are on for all managers by default; Configure manager settings presents it as an optional setting.	Check Manager settings in your tenant.
Manager export	Export AI cost metrics says manager export will be available by the end of July, a date that has passed; Configure manager settings says selecting the manager option lets eligible managers access team-scoped data and export it.	Test with a pilot manager.
Tasks and billed sessions	Advanced analysis metrics defines a credit session as a task or conversation, including scheduled tasks; How to use the Consumption Dashboard says several tasks, especially scheduled ones, can map to one billed session.	Compare your exported counts against both definitions.
License Administrator permissions	Set up usage-based billing for Copilot Credits lists the role both as able to edit spending policies and as a read-only viewer.	Test with a pilot account.

Agent Dashboard identifiable export	Identification lists it as private preview; Export data from the Agent Dashboard says public preview.	Check availability in your tenant.
Services in the consumption export	How to use the Consumption Dashboard says consumption data covers only Cowork and the Work IQ API; Export AI cost metrics gives example service names that include Researcher, BizChat, Deepwork, Outlook, and WXP.	Check the <code>ServiceName</code> values in your file.
Task category names	Advanced analysis metrics uses Document & comment task ; Copilot Cowork usage describes the Value tab category as document and content creation.	Keep the labels separate until you've confirmed how they map in your tenant.
Blocking specific users	Cowork common questions says to add users to a security group excluded from the Copilot experience; Cowork access controls says to leave them out of every policy that includes Cowork.	Test the route on a pilot user and confirm the outcome.
Manager eligibility for consumption insights	Configure manager settings counts direct and indirect reports toward the minimum team size; the Microsoft 365 Copilot release notes say access is scoped to managers with at least five direct reports.	Test a manager whose whole team meets the minimum but who has fewer than five direct reports.
Where detailed charges live	How to use the Consumption Dashboard points to the Microsoft 365 admin center for official billing and detailed charges; Admin center vs. your Azure bill says Bills & payments gives invoices and a high-level snapshot, with detailed analysis in Azure Cost Management.	Use Bills & payments for invoices and Azure Cost Management for detail, and confirm with your billing administrator.

What Microsoft doesn't document

Gap	What to do
Cowork's exact general-availability date (only June 2026 is given)	Use the month only.
Grace period length and terms	Set up billing before the date on the Grace period card.
Roles for the Value and Settings tabs, what the summary-only roles see, and whether the Copilot administrator role is the AI Administrator role	Test with the accounts you plan to use.
Whether the Value tab needs tenant or user Frontier enrolment	Test with a pilot account.
Refresh latency of the admin center dashboard	Use the Last updated timestamp.
Admin center CSV headers, encoding, and row limits	Check the first export before you automate anything.
How event-driven tasks, triggered by an email or a Teams message, are counted	Don't compare event-driven workloads until you've tested them.
A rate or currency for Cowork assisted hours	Don't convert assisted hours to money.
Small-group suppression in the Consumption Dashboard	Check it in your tenant before you share group-level views.
How the report concealment setting and the Identification policy apply to the Cowork table and its export	Check the table and the CSV with the intended role, and treat both as personal data.

10. Sources

Dates are the “Last updated on” date shown on each page.

Source	Last updated	Used for
Copilot Cowork usage	23 September 2026	Tabs, definitions, Frontier label, export
Usage reports overview	28 August 2026	Permissions, name concealment, availability by cloud
What's new in Cowork	25 September 2026	General availability month
Manage Copilot Cowork	14 September 2026	Spending–policy access, discoverability
Cowork access controls	8 September 2026	Access decisions, limit enforcement
Cowork plugins	1 September 2026	Plugin roles
Cowork common questions	29 September 2026	Blocking Cowork for users, event–driven tasks
Get started with Cowork	14 September 2026	Licence prerequisite
Managing usage–based billing	2 October 2026	Spending policies under Cost management
Set up usage–based billing for Copilot Credits	2 October 2026	Billing roles, first–time setup, default policy scope
Admin center vs. your Azure bill	25 September 2026	Dashboards versus the billing record
Get started with the Frontier Program	7 October 2026	Frontier enrolment
Microsoft 365 Copilot release notes	24 September 2026	Consumption Dashboard release and manager scope
Consumption Dashboard	8 September 2026	Roles, Cowork page, tasks versus sessions
Export AI cost metrics	8 September 2026	Export roles, windows, columns

Advanced analysis metrics	7 October 2026	Cowork metric definitions
Create a custom consumption query	2 July 2026	Consumption query metrics
Identification	24 September 2026	Identification and its access policy
Export data from the Agent Dashboard	29 July 2026	Agent Dashboard identifiable-export preview status
Delegate access	16 September 2026	Delegation scopes
Configure manager settings	23 July 2026	Manager access
Supported environments	30 September 2026	Availability by cloud
Copilot Dashboard	29 September 2026	Copilot Dashboard Assisted Hours
Agent Dashboard (preview)	2 September 2026	Cowork leaving the Agent Dashboard
Cowork methodology (PDF)	No date shown	Task categories and method

Microsoft can change coverage, licensing, roles, interfaces, and cloud availability at any time. Revalidate these sources and the tenant before any material process or decision.

11. What to Read Next

Document	Use it for
Consumption Dashboard Operations	Roles, usage intensity, spending-policy limits, and export
Billing Operations	Licensing models, lifecycle events, capacity, and chargeback controls
Dashboard Guide	The Copilot Dashboard Impact page, delegation, and the Agent Dashboard
Programmatic Reporting Options	Dashboard export, Advanced queries, Graph APIs, and audit data
Troubleshooting Guide	Wider Copilot Analytics access and data issues
