

Copilot Dashboard & Analytics for Multi-Agency Single Tenant

Version: 2.1 | Author: Sumit Sadhu | Published: March 2026

 **Don't need hard data isolation?** If agencies are comfortable seeing each other's aggregate data and just want their own dashboards as the *default* view, use the simpler **Multi-Agency Default-Priority Architecture** instead. It leverages native AutoCxO, delegation, and "Your group" scoping — no lockdowns or partitions required.

Three operating models for isolated Copilot reporting

If you're evaluating the isolation model, there are three ways to operate it. They differ in *who* runs the analytics and *where* each agency's boundary is enforced — which in turn drives the setup effort.

#	Operating model
1	Hybrid — Central IT on the global partition, plus one partition per agency for that agency's own analysts
2	Central, per-partition — central analysts assigned to individual agency partitions; each agency receives only its d
3	Central + RLS — central analysts on the global partition; one shared report, with Power BI <u>RLS</u> filtering each agenc

 **Boundary strength differs — read before choosing Model 3.** Models 1 and 2 are anchored on **Viva Insights partitions** — a data-layer boundary an analyst cannot cross. Model 3 is the lowest-effort but the **softest** boundary: there is no per-agency partition, so all agencies' data co-resides in **one Power BI dataset**, and RLS only constrains workspace **Viewers** — anyone with **Admin, Member, or Contributor** access sees every agency (RLS reference). Choose Model 3 only where Central IT fully governs workspace roles and *hard* data-layer isolation is not a compliance requirement; otherwise use Model 1 or 2, detailed below.

TL;DR — Two Paths to Agency Isolation

Both paths share the same Phase 1 lockdown. Choose your data strategy based on your environment:

	Path A: CSV Org Data Upload	Path B: Entra Domain
When to use	Agencies share one email domain, OR you need Department + Agency filtering	Each agency has its own email domain
Partition filter	Agency = "Agency A"	Domain = "example.com"
Data upload needed?	Yes — CSV with Agency attribute	No — Domain filter
Extra filtering	Full: Department, Location, Job Function, etc.	Limited to Email Domain

Common Steps (both paths):

- 1. Lock down the Copilot Dashboard to Central IT only (VFAM + Entra group) — Phase 1
- 2. Choose your data strategy — CSV upload (Path A) or Entra Domain (Path B) — Section 4.1
- 3. Create one partition per agency in Viva Insights — Phase 3
- 4. Assign agency-specific analysts to their partitions only — Section 7
- 5. Deliver reports via Publish Reports or isolated Power BI workspaces — Phase 4

Time estimate: 1–3 days depending on path chosen.

Prerequisites & Licensing

Requirement
1+ assigned Copilot licences for core dashboard; for advanced features (benchmarks, Agent Dashboard, sentiment, deleted items) 2+ assigned Copilot licences
Insights Admin + AI Admin roles assigned
Compliance / Legal sign-off
Minimum group size agreed by all agencies

Potential extra costs (evaluate before Phase 4):

- Power BI Pro/PPU: Required per viewer if delivering reports via PBI workspaces. Alternative: Power BI Premium capacity (P or F SKU) allows free-licence viewers.
- Viva Insights standalone: Required for agency heads who need Publish Reports access but do not have a Copilot licence (Copilot licence includes Viva Insights automatically).

How to Use This Document

Read Section 4.1 to choose your data path (A or B). Then follow Section 5 phases 0–4 sequentially. Refer to §7–

§9 for ongoing governance. If you need to assess your environment first, start with the Discovery Questions in Section 10.

1. Executive Summary

This document provides a validated, end-to-end solution architecture for deploying Microsoft Copilot Dashboard and Copilot Analytics in a **single Microsoft 365 tenant** that hosts **multiple independent agencies**. Each agency operates as a distinct organization with its own CEO and full management hierarchy, but all share one Entra ID tenant.

Core Constraint & Key Finding:

The customer requires that Agency A cannot see Agency B's Copilot usage data. After validation against official Microsoft documentation, **the Copilot Dashboard does not natively support hard data isolation between organizational units within a single tenant**. Users identified as "senior leaders" by Entra ID hierarchy will always see "Your company" data, which includes all agencies.

Recommended Approach: A Two-Tier Architecture

- 1. **Viva Insights Advanced Analytics with Partitions** — for agency-isolated Copilot reporting (primary reporting surface for agencies).
- 2. **Copilot Dashboard with controlled access** — for tenant-level oversight by central IT only (secondary, restricted use).

2. Business Context & Requirements

2.1 Organizational Structure

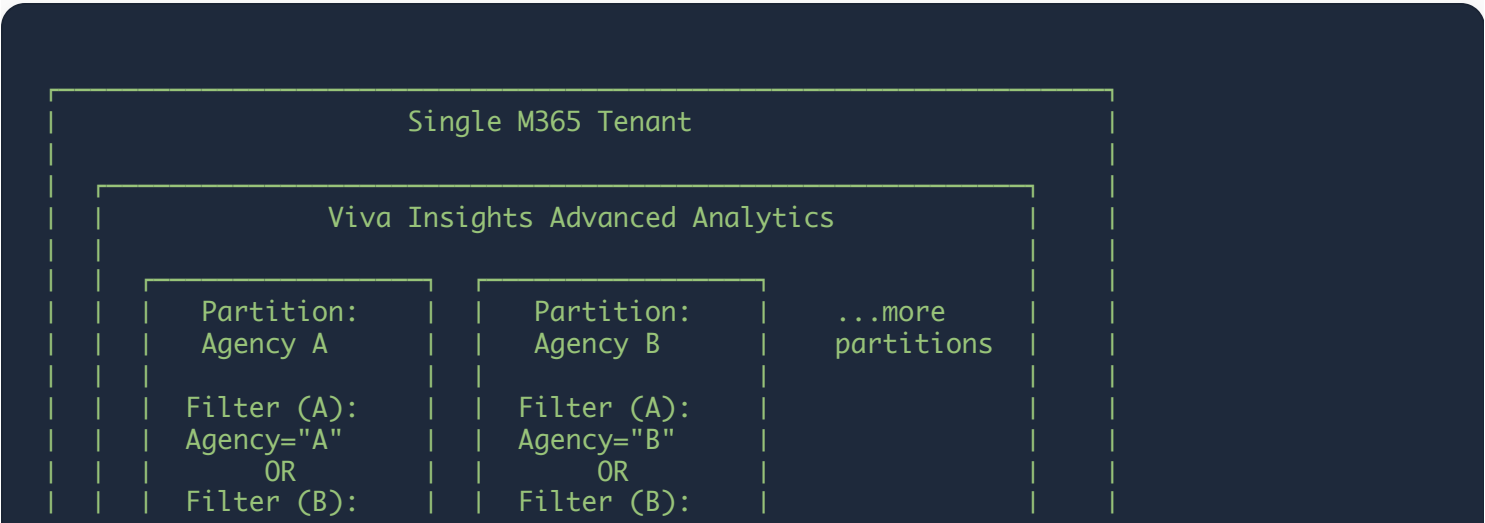

2.2 Functional Requirements

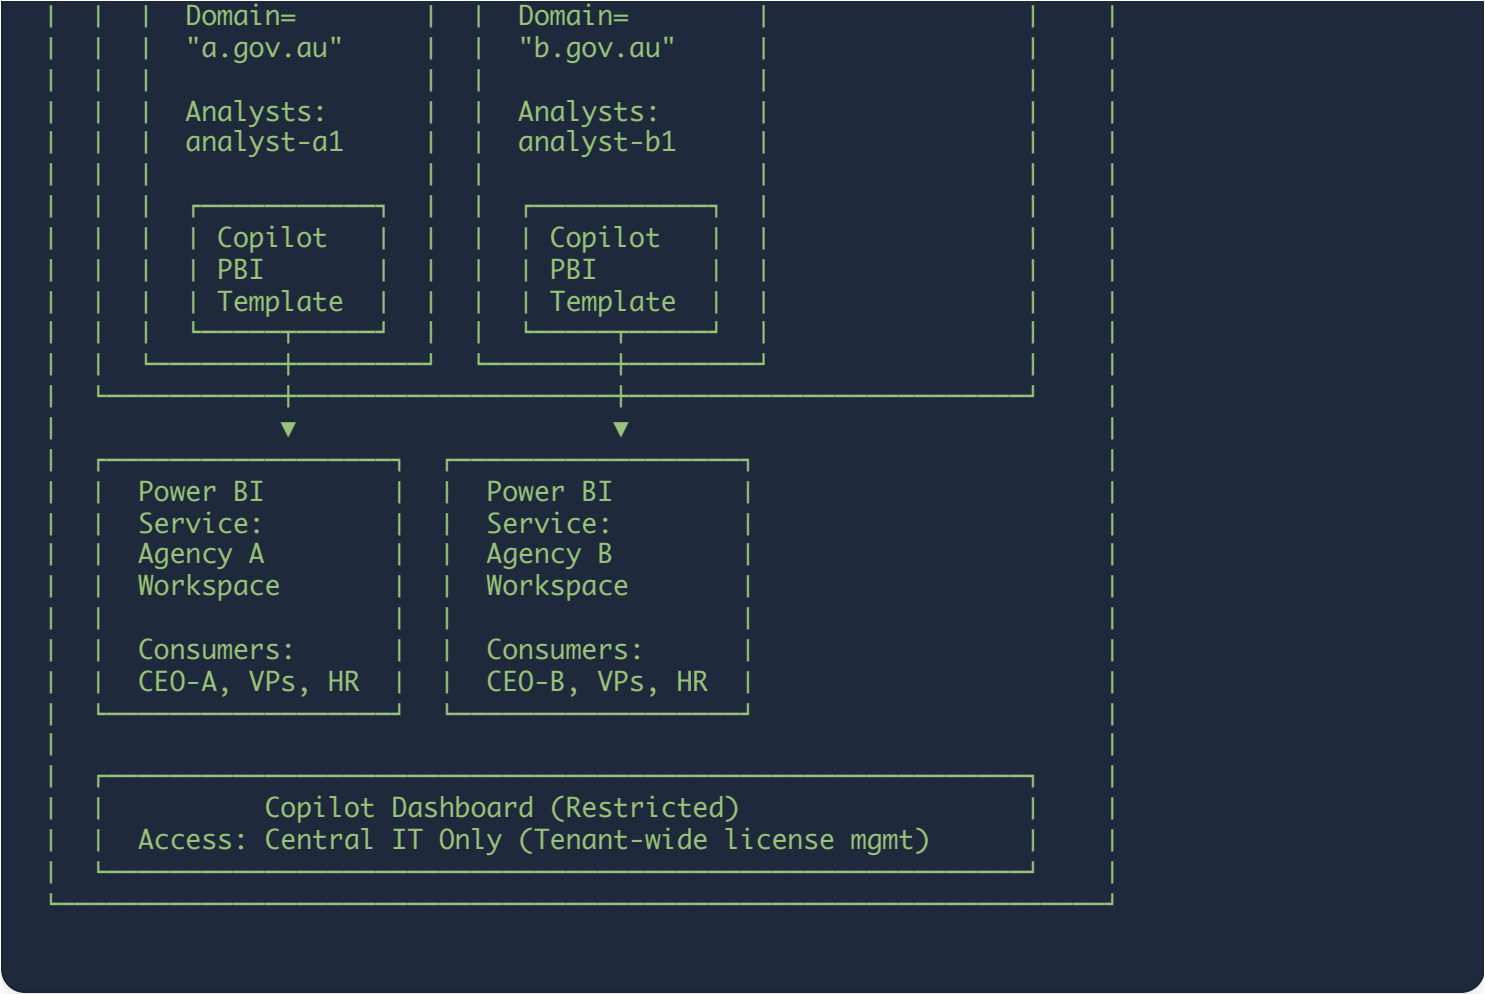

ID	Requirement	Priority
FR-01	Agency A leaders see ONLY Agency A Copilot usage data	P0 — Must Have
FR-02	Agency A leaders CANNOT see Agency B/C aggregate data	P0 — Must Have
FR-03	Each agency CEO gets adoption, impact, and sentiment metrics	P1 — Should Have
FR-04	Central IT retains tenant-wide visibility for license management	P1 — Should Have
FR-05	Agency-level analysts can run custom Copilot queries	P2 — Nice to Have

3. Solution Options Assessment

Option	Description	FR-01 (Is it possible to see only Agency A data?)
1. Dashboard Only	Standard deployment relying on "Your group" scope.	❌ Fail
2. Dashboard + Delegation	Admin delegates "Your group" view to CEOs.	❌ Fail
3. Partitions (Advanced Analytics)	Create Viva Insights Partitions per agency.	✅ Pass
4. Hybrid (Partitions + Restricted Dashboard)	Partitions for agencies + Dashboard for Central IT.	✅ Pass

4. Recommended Architecture

4.1 Choose Your Path: CSV Org Data vs. Entra ID Domain

Viva Insights partitions filter on **organizational data attributes**. Attributes reach Viva Insights from two sources:

Source	Attributes Available
Microsoft Entra ID (automatic sync)	PersonId , ManagerId , Organization (from Entra Department field), pl
CSV Org Data Upload	All of the above, plus up to 105 custom attributes: Agency , FunctionType ,

Path A: CSV Org Data Upload (Full Capability)

Use when:

- All agencies share the **same email domain** (e.g., everyone is @onetenant.gov.au)
- You need **both agency isolation AND department/location/job function filtering** within each agency
- You want the richest possible analytics (custom attributes, before/after cohort segmentation)

- HR can provide a consolidated employee CSV with an `Agency` column

Partition filter: `Agency = "Agency A"`

End-to-end workflow:

1. Phase 0: Pre-flight audit (same as Path B)
2. Phase 1: Lockdown — disable AutoCxO, delegation, Agent Dashboard, Metrics Export (same as Path B)
3. **Phase 2: Prepare and upload CSV** with `PersonId`, `ManagerId`, `Organization`, `EffectiveDate`, and custom `Agency` attribute. Verify 100% coverage on Data Quality page.
4. Phase 3: Create partitions filtered by `Agency = "Agency A"`, etc. Assign analysts.
5. Phase 4: Analysts run Copilot PBI queries within their partition → publish reports.

Time estimate: 2–3 days. **Ongoing:** Monthly CSV re-upload to keep data current.

Path B: Entra ID Domain Filter (Zero CSV)

Use when:

- Each agency has a **distinct email domain** (e.g., `agencya.gov.au`, `agencyb.gov.au`)
- All employees use their agency domain as their **primary SMTP address**
- You **do not** need custom attribute filtering (Department/Location come only from Entra defaults)
- You want the **fastest possible deployment** with zero data preparation

Partition filter: `Domain = "agencya.gov.au"`

End-to-end workflow:

1. Phase 0: Pre-flight audit (same as Path A)
2. Phase 1: Lockdown — disable AutoCxO, delegation, Agent Dashboard, Metrics Export (same as Path A)
3. **Phase 2: Skip CSV upload.** Optionally enable `ManagerId` and `Organization` in “Configure Entra connection” for richer hierarchy and department data.
4. Phase 3: Create partitions filtered by `Domain = "agencya.gov.au"`, etc. Assign analysts.
5. Phase 4: Analysts run Copilot PBI queries within their partition → publish reports.

Time estimate: 1 day (no data prep). **Ongoing:** No CSV maintenance — Domain auto-updates as employees join/leave.

Decision Matrix

Question	If Yes → Path
Do all agencies share the same email domain?	Path A (CSV required — <code>Domain</code> cannot differ
Does each agency have a unique email domain?	Path B is available (can also use Path A for rich
Do you need Department/Location/Job Function filters per agency?	Path A (CSV adds these attributes beyond Entr
Are there shared-services staff on a common domain?	Path A preferred (assign <code>Agency = "Shared S</code>
Need the fastest deployment with minimal data preparation?	Path B (zero CSV, Domain-only filter)
Want to start with Path B and add CSV later?	Path B now, Path A later — you can always up

Important: Whichever path you choose, the **Phase 1 lockdown** and **partition-based isolation architecture** are identical. The only difference is *how employee data reaches Viva Insights* and *which attribute you filter partitions on*.

4.2 Entra ID Attributes Reference for Viva Insights

Understanding exactly which Entra ID attributes reach Viva Insights is critical for choosing the right path. Per Microsoft Learn:

Already know your path? If you have already decided between Path A and Path B in Section 4.1, you can skip this reference section and go directly to the Implementation Runbook (Section 5).

Attributes Synced from Entra ID

Entra ID Source Field	Viva Insights Attribute	Available for Partition Filter?	Notes
<code>UserPrincipalName</code>	PersonId	No (identifier only)	Always synced
<code>Manager / UserPrincipalName</code>	ManagerId	Yes (required attribute)	Enable via "Configure Er
<code>Department</code>	Organization	Yes (required attribute)	Enable via "Configure Er

System-Generated Attributes (Always Available)

Attribute	Source	Available for Partition Filter?	Multi-Agency Use
Domain	Primary SMTP address	Yes	Key attribute for Path B — if each agency has a unique domain
TimeZone	Outlook/Exchange settings	Yes	Useful for filtering by geography but not for partitioning
PopulationType	SMTP address	Yes	Distinguishes internal vs. external contacts

Attributes NOT Available from Entra ID

The following Entra ID user profile fields are **not** synced to Viva Insights. If you need them, you must upload via CSV:

On-Premises Active Directory Pipeline: If your directory hierarchy starts in **on-premises Active Directory** and syncs to Entra via AD Connect, only the three attributes listed above (PersonId, ManagerId, Organization) reach Viva Insights. Custom on-prem attributes (extension attributes, custom schema extensions, department codes) do **not** flow through to Viva Insights — even if they are synced to Entra ID. You must upload these as custom attributes via CSV.

Entra ID Field	Status in Viva Insights
Company	Not synced — use CSV Organization or custom attribute
Division	Not synced
JobTitle	Not synced — use CSV FunctionType
City / Country / State	Not synced — use CSV Location / CountryOrRegion
EmployeeType	Not synced
extensionAttribute1-15	Not synced

Common Misconception: Many customers assume that because they have Company , Division , or extensionAttributes populated in Entra ID, these will automatically appear in Viva Insights. They will not. Only the three attributes listed above (PersonId, ManagerId, Organization) sync from Entra. Everything else requires a CSV upload.

Parallel Data Ingestion (Best of Both Worlds)

You can use **both** Entra ID and CSV simultaneously via the parallel data ingestion feature:

- Let Entra continue providing `ManagerId` and `Organization` (always accurate, auto-refreshing)
- Upload a CSV with **only** the additional attributes you need (e.g., `Agency`, `Location`, `CostCentre`)
- Entra-sourced attributes take precedence for the fields you select; CSV provides the rest

This is ideal for organisations starting with **Path B** (Domain-based) who later want to add richer attributes without disrupting existing Entra-based data flows.

5. Implementation Runbook

0 Phase 0: Pre-Flight Audit

Before locking anything down, audit the current state and obtain approvals. Disabling policies does not revoke existing access.

Pre-flight approvals (complete before proceeding):

1. Obtain **written sign-off from Compliance / Legal / DPO** that the partition-based isolation strategy meets your regulatory and governance requirements.
2. Confirm **all agency heads and compliance officers agree** on the minimum group size threshold (see Phase 3). Document the agreed number.
3. Confirm **role assignments** are in place: AI Admin and Insights Admin roles assigned to Central IT staff via M365 Admin Center → Settings → Viva → Viva Insights → Add-on Plan, or via Role assignments → search role name. (Learn reference)

- **Audit VFAM policies (Admin UI):** Navigate to `admin.microsoft.com` → Settings → Microsoft Viva → Viva Insights → Set up and management → **Turn Advanced Insights on or off**. Review the status of each feature: AutoCxoldentification, CopilotDashboardDelegation, AgentDashboard, CopilotMetricsReport. Document the current state (On/Off, scope: Everyone or Specific users).
- **Alternative (PowerShell):** Run `Get-VivaModuleFeaturePolicy -ModuleId VivaInsights` for a scripted audit of all policies.
- **Audit dashboard access list:** Admin Center → Settings → Viva → Viva Insights → **Manage user access for Copilot Dashboard**. Check who currently has access.
- Identify any agency CEOs or leaders who already have dashboard access (auto-enabled or manually added).
- Verify the Entra ID ManagerID hierarchy — confirm each agency CEO reports to a different top-level node (not to each other).

1 Phase 1: Foundation (Lockdown)

Prevent agency CEOs from being auto-identified as senior leaders and getting tenant-wide access. Complete each sub-step in order. **Requires AI Administrator role.**

Group-Scoped Policies — Protect Non-Agency Leaders

VFAM policies set to “Everyone” affect the **entire tenant** — including non-agency executives (CFO, CISO, CIO) who may legitimately need dashboard access. To avoid this, create an Entra security group called `AgencyUsers-NoDashboard` containing all agency employees. Target your disable policies at **this group** instead of Everyone. This preserves access for Central IT, Finance, and other non-agency stakeholders.

All steps below use group-scoped targeting. See Appendix A for the full PowerShell reference.

1.1 — Disable Auto CxO Identification

Admin Center → Settings → Viva → Viva Insights → Turn Advanced Insights on or off → select **Auto CxO Identification** → Add policy → scope to `AgencyUsers-NoDashboard` → set to **Off** → Save.

1.2 — Remove existing auto-enabled agency leaders

Admin Center → Settings → Viva → Viva Insights → **Manage user access for Copilot Dashboard** → remove any agency leaders who were auto-identified. Leave non-agency executives (CFO, CISO, etc.) in place if they need tenant-wide access.

1.3 — Disable Dashboard Delegation for agency users

Same “Turn Advanced Insights on or off” page → select **Copilot Dashboard Delegation** → Add policy → scope to `AgencyUsers-NoDashboard` → set to **Off** → Save.

1.4 — Restrict dashboard access to Central IT

Create Entra group `CentralIT-CopilotDashboard-Access`. In **Manage user access for Copilot Dashboard** → add this group → remove all individual agency users.

Supported group types for dashboard access: Entra security groups, Microsoft 365 groups, and mail-enabled security groups. Distribution-only groups are **not supported**. All group members must have a Viva Insights service plan (included with Copilot licence). Changes take up to **24 hours** to propagate. If group-based access does not work as expected, verify: (a) all members are licensed, (b) the group type is correct, (c) 24 hours have elapsed since assignment.

1.5 — Disable Agent Dashboard for agency users

Same page → select **Agent Dashboard** → Add policy → scope to **AgencyUsers-NoDashboard** → set to **Off** → Save. Create a second policy to re-enable for Central IT if needed.

1.6 — Disable Copilot Metrics Export (PowerShell only)

This feature does not have an Admin UI toggle. Use PowerShell:

```
Add-VivaModuleFeaturePolicy -ModuleId VivaInsights -FeatureId CopilotMetricsReport -Name "DisableMetricsExport" -IsFeatureEnabled $false -GroupIds AgencyUsers-NoDashboard@tenant.com
```

1.7 — Optional: Disable Viva Insights web app for non-permitted users (strongest lockdown)

The Viva Insights web app VFAM control disables the **entire** web app (Copilot Dashboard, Analytics Reports, and admin/analyst tools) for targeted users. Scope the disable policy to **AgencyUsers-NoDashboard**. This keeps the web app On for Central IT and agency analysts while blocking everyone else.

Note: If you previously disabled the old “Copilot Dashboard” VFAM control, those settings now apply to the entire web app.

After Phase 1 — Verification:

1. Confirm no agency leaders appear in the dashboard access list.
2. Verify VFAM policies (AutoCxo, Delegation, AgentDashboard, MetricsExport, and optionally web app) show as disabled for the **AgencyUsers-NoDashboard** group.
3. Have an agency CEO attempt to access **insights.cloud.microsoft** and confirm access is denied.
4. Have a non-agency executive (e.g., CFO) confirm they **still** have dashboard access.

2 Phase 2: Organizational Data

Prepare the foundational data that enables partitioning. Your approach depends on which path you chose in Section 4.1. For detailed refresh cadence tables, see Section 6: Organizational Data Strategy.

Path A: CSV Org Data Upload

- Create a consolidated CSV file containing ALL employees across ALL agencies.
- Include the critical custom attribute: **Agency** (e.g., "Agency A", "Agency B").
- Include required fields: **Microsoft_PersonEmail**, **Microsoft_ManagerEmail**, **Microsoft_Organization** (M365 Admin Center names) or **PersonId**, **ManagerId**, **Organization**, **EffectiveDate** (legacy Viva Insights names).
- Upload via M365 Admin Center (post-migration) or Viva Insights web app (legacy). Alternatively, if your HRIS supports it, configure a **SAP SuccessFactors** or **Workday connector** with the **Agency** attribute mapped, or use the **API-based import** for automated ingestion.

Path A Verification:

Check Viva Insights Admin → Data Quality to verify the **Agency** attribute has 100% coverage. Verify employee counts per agency match HR records.

Path B: Entra ID Domain (No CSV)

- **No CSV upload required.** The **Domain** attribute is system-generated from each employee's primary SMTP address.
- **Recommended:** Navigate to Viva Insights → Organizational data → **Configure Entra connection** → enable **ManagerId** and **Organization** checkboxes → **Save**. This enriches your data with manager hierarchy and department info (takes ~24 hours to sync).
- Verify domain mapping: confirm that each agency's employees use a distinct email domain (e.g., **agencya.gov.au**, **agencyb.gov.au**).

Path B Verification:

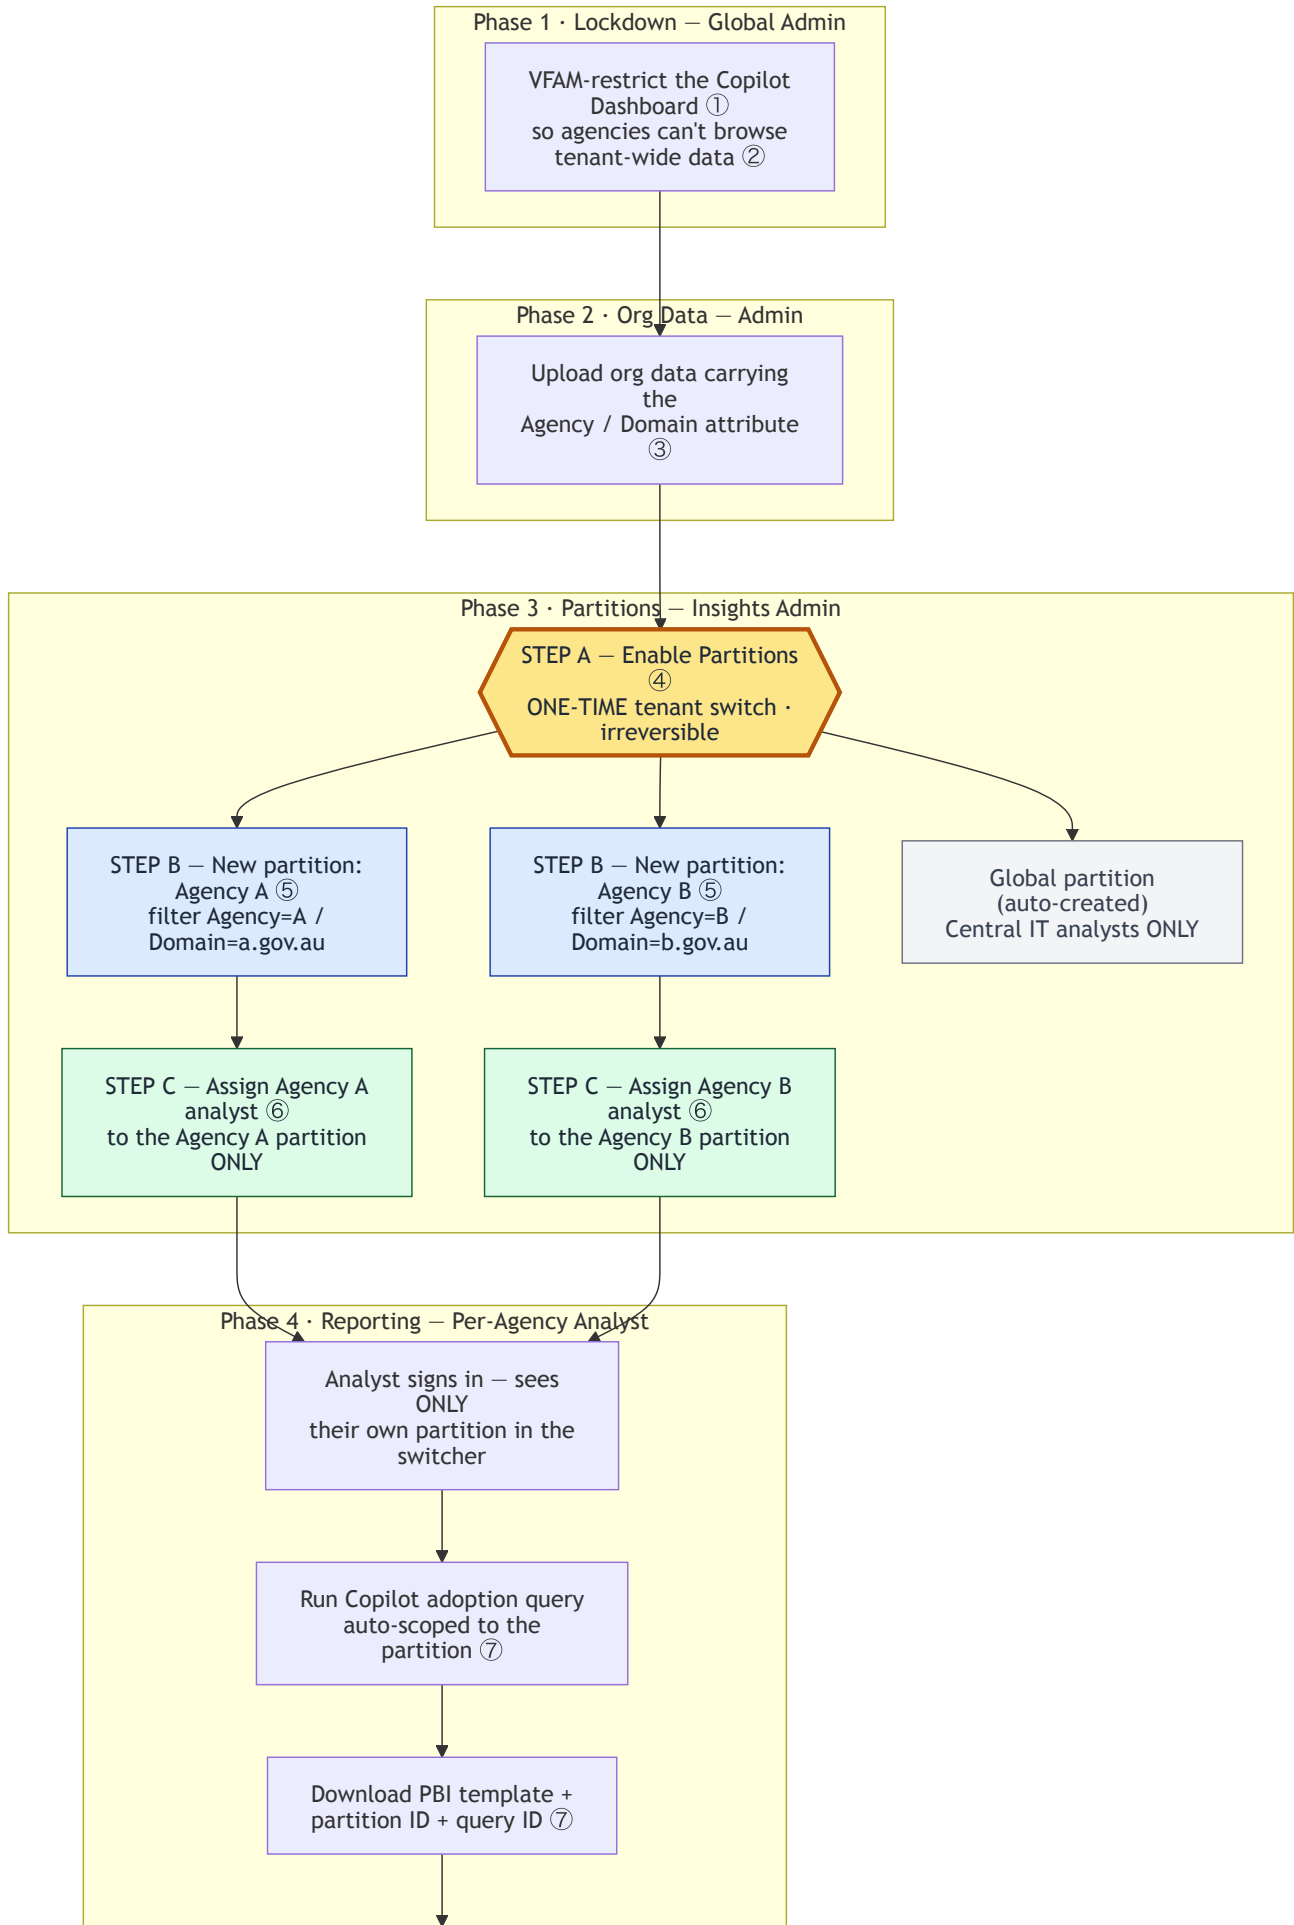

In Viva Insights Admin → Organizational data, verify that **Domain** appears as an available attribute. Check the Data Quality page to see Domain values and confirm they cleanly map to agencies. If any employees use a shared domain (e.g., contractors on **shared.gov.au**), decide how to handle them (see Shared Services Decision below).

Shared Services Decision (both paths): If your organisation has shared-services teams (IT, Legal, Finance) that serve multiple agencies, choose one of these approaches:

1. **Dedicated "Shared Services" partition** (recommended) — Create a separate partition filtered by `Agency = "Shared Services"` (Path A) or `Domain = "shared.gov.au"` (Path B). Central IT analysts access this partition alongside the global partition.
2. **Global partition only** — Exclude shared services from all agency partitions. Their data is only visible in the global partition (Central IT only).
3. **Include in every agency partition** — Not recommended. Creates duplicate data and inflates agency metrics.

3 Phase 3: Partitions Setup

Create the hard data boundaries. The partition filter differs by path, but all other steps are identical.

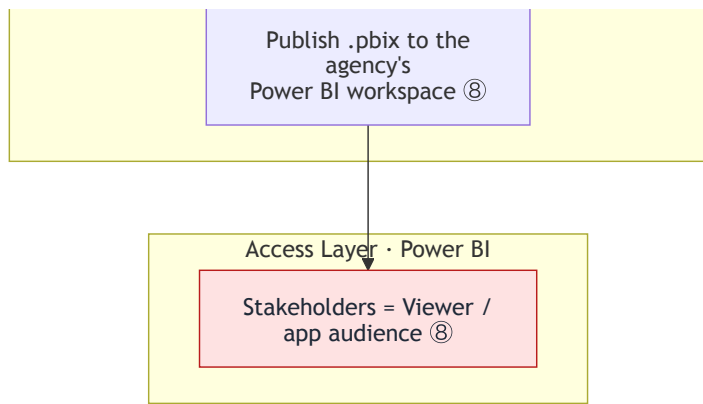

Figure 1 — Where partition enabling fits. Phase 3 has *two distinct actions that are easy to conflate*: **Enable Partitions** (④) is a *one-time, tenant-wide, irreversible* switch you flip *once*, whereas **New partition** (⑤) is repeated *once per agency*. Assigning each analyst to their own partition only (⑥) is what makes the boundary hold. Each numbered step links to its verified Microsoft Learn reference:

1. ① VFAM lockdown of the Copilot Dashboard — Viva feature access management
2. ② What gets locked down (the tenant-wide view) — Connect to the Copilot Dashboard
3. ③ Upload org data carrying the Agency / Domain attribute — Organizational data in Microsoft 365
4. ④ **Enable Partitions** — the one-time tenant switch — Customize privacy settings → Partitions
5. ⑤ **Create one partition per agency** and set its filter — Partitions in Viva Insights
6. ⑥ Assign the Insights Analyst to their partition **only** — Assign user roles
7. ⑦ Run the Copilot query & download the Power BI template (partition + query IDs) — Microsoft 365 Copilot adoption report
8. ⑧ Distribute via a Power BI workspace/app to a Viewer audience — Roles in workspaces · Publish an app

Before Enabling Partitions — Confirm:

- (a) **Path A:** You have a reliable, repeatable process for monthly org data uploads with the Agency attribute. **Path B:** You have verified Domain values cleanly map to agencies.
- (b) You have identified at least one Insights Analyst per agency.
- (c) You accept that once enabled, turning off partitions requires contacting Microsoft support and will **delete all partition configurations, query results, and custom metrics** created within partitions.
- (d) You understand that privacy settings (minimum group size) are tenant-wide, not per-partition — all agencies must agree on the number.
- (e) **Export all existing Viva Insights reports and query results** before enabling partitions. Download from Analysis results → select each query → Download CSV or open in Power BI. There is no built-in rollback once partitions are enabled.

- Navigate to `insights.cloud.microsoft` → **Admin** → **Privacy settings** → **Partitions**. Select **Enable Partitions**.
- Select **New partition**. Name it (e.g., "Agency A").
 - **Path A filter:** Set `Agency = "Agency A"`

- **Path B filter:** Set `Domain = "agencya.gov.au"`

Verify the **Filtered employees** counter matches the expected headcount for that agency. Select **Save**.

- Click the newly created partition → **Edit** → **Analysts** tab → **Add analysts**. Search for the designated agency analyst by name or email → select → **Save**. Assign agency analysts to their respective agency partitions **only**. Do NOT assign agency analysts to the global partition.
- Assign Central IT analysts to the automatically created **Global Partition** for tenant-wide queries.
- Repeat for each agency. Allow 1–2 hours for partition access to propagate.

Why agency analysts must NOT have global partition access: Analysts with global partition access automatically get Copilot Dashboard access AND Copilot Analytics Reports access — both of which show tenant-wide data across all agencies. This would defeat the entire isolation architecture.

After Phase 3 — Verification:

Have each agency analyst sign in to `insights.cloud.microsoft`. Confirm they only see their agency's partition in the partition switcher. Have them run a test person query and verify the employee count matches their agency only.

Analyst Onboarding Checklist — First Day in a Partition

Share these steps with each agency analyst after they receive partition access:

1. Sign in to `insights.cloud.microsoft` with your analyst account.
2. Look for the **partition switcher** in the top bar. Select your agency's partition (e.g., "Agency A").
3. In the left nav, select **Create analysis**. You should see Power BI templates (Copilot Adoption, Impact Explorer, Business Impact, etc.) and the custom person query option.
4. Run a **test Person Query**: select a few basic Copilot metrics, set a 28-day window, and run. Verify the employee count in the results matches your agency's expected headcount.
5. Verify you **cannot** see: the Copilot Dashboard in the left nav, any Admin panel, or any partition other than your own in the switcher.
6. Check **Analysis results** — you should only see queries you or other analysts in your partition have run. No cross-agency queries should appear.

If anything doesn't match, contact your Insights Admin to verify partition assignment and role configuration.

4 Phase 4: Copilot Reporting

Generate and distribute the isolated reports.

4a — What Copilot Analytics Are Available in a Partition?

Not all Copilot analytics surfaces are partition-scoped. Use this matrix to set expectations with agency stakeholders:

Analytics Surface	Available in Agency Partition
Custom Person Queries (Copilot metrics)	YES — scoped to agency partition
Power BI Templates (Copilot Adoption, Impact Explorer, Business Impact, Headlines, etc.)	YES — scoped to agency partition
Custom Metrics & Metric Rules	YES — isolated per agency partition
Analysis Results	YES — isolated per agency partition
Copilot Dashboard	NO — tenant-level
Copilot Analytics Reports (OOB reports)	NO — requires global access
Agent Dashboard	NO — tenant-level
Readiness / Licence Utilisation	NO — M365 Admin
Sentiment (Viva Glint / CSV survey)	NO — tenant-level
Satisfaction Rate (thumbs up/down)	NO — tenant-level

Key takeaway: Agency analysts get full access to **Copilot adoption and impact metrics** through custom queries and PBI templates, scoped to their agency's employees only. They do **not** get the interactive Copilot Dashboard, OOB Analytics Reports, or sentiment data — those remain Central IT surfaces.

4b — Deliver Reports to Agency Heads

- Agency analysts run Copilot Power BI template queries within their isolated partition.

Option A: Power BI Workspaces (requires Power BI Pro/Premium licences for viewers)

- Create dedicated Power BI workspaces per agency (e.g., **Agency-A-Copilot-Analytics**).
- Publish reports and grant Viewer access to agency leadership via Entra group.

- **Licensing:** Each viewer needs a **Power BI Pro** or **Premium Per User (PPU)** licence. Alternatively, if your organisation has a **Power BI Premium capacity** (P or F SKU), reports published to that capacity can be viewed by users with a free Power BI licence — eliminating per-user viewer costs. Consult your licensing/finance owner.

Option B: Viva Insights Publish Reports (prerequisites apply — review notes below)

- Use the **Publish Reports** feature in the Viva Insights analyst experience.
- **“Filter report by manager hierarchy”:** Publishes to enabled managers only. Each recipient sees only their own team’s data. If the agency CEO’s hierarchy covers the entire agency, they see the full agency dataset.
- **“Unfiltered original report”:** Publishes to users who have been granted **Copilot Dashboard access**. In the multi-agency lockdown, dashboard access is restricted to Central IT — so this sub-option does **not** reach agency heads.
- Recipients view published reports in the Viva Insights web app → Reports tab.
- Set expiry date (up to 365 days) and republish as needed.

⚠ Publish Reports Risk in Multi-Agency:

Enabling a manager grants them **automatic Copilot Dashboard access** (Learn reference), including the “Your company” scope showing **all agencies’ data**. Before using “Filter by manager hierarchy,” test with one pilot agency CEO and verify they cannot toggle to “Your company” on the Copilot Dashboard. If they can, fall back to **Option A (Power BI workspaces)** for agency-head delivery.

Recommendation: Use Option A as the primary delivery surface for agency heads. Reserve Publish Reports for Central IT analysts who already have dashboard access.

⚠ Licensing Prerequisite for Publish Reports Recipients:

To view published reports, recipients must have a **Viva Insights service plan**. This is automatically included with every M365 Copilot licence. However, if an agency head does **not** have a Copilot licence, they will need a **standalone Viva Insights licence** to access published reports in the web app. Confirm licensing coverage before choosing this delivery path.

Publish Reports Pilot Procedure (recommended before full rollout):

1. Select **one pilot agency CEO** who has a Copilot licence (Viva Insights service plan included).
2. In Manager Settings, enable this CEO as a manager (ensure their team meets minimum team size).
3. Wait 1 hour for manager settings to propagate.
4. Have the pilot CEO navigate to insights.cloud.microsoft. Check whether they can see the **Copilot Dashboard** in the left nav and whether it shows “Your company” data across all agencies.

5. **If they can see cross-agency data:** Fall back to Option A (Power BI workspaces). Disable the pilot CEO's manager access.
6. **If they only see their team's data:** Proceed with publishing filtered reports to remaining agency CEOs.
7. After pilot, publish a Copilot PBI template report using "Filter by manager hierarchy" and verify the CEO receives only their agency's data.

After Phase 4 — Verification:

Have an agency CEO view their report (either PBI or Viva Insights). Confirm: (a) only their agency's employees appear, (b) no cross-agency group names or data are visible, (c) the minimum group size threshold is respected for small departments within the agency.

6. Organizational Data Strategy

How employee data reaches Viva Insights depends on your chosen path. Both paths share the same Copilot usage data (automatic from M365).

6.1 Path A: CSV Org Data Upload

Data Type	Source
Employee hierarchy (ManagerId)	Centralized HR or per-agency HR feeds (CSV), HRIS connector, or API-k
Custom attributes (Agency, FunctionType)	HR system (via CSV, HRIS connector, or API)
Copilot usage data	Automatic from M365 signals

Data Quality Rule: The **Agency** attribute must have 100% coverage. Missing values will exclude employees from all partitions.

Data Ownership Model for Multi-Agency CSV Management

1. **Designate one Central IT owner** responsible for the consolidated CSV file across all agencies.
2. **Establish a monthly collection process:** Each agency HR team exports their employee data extract → Central IT merges all extracts into a single CSV with the **Agency** attribute populated for every row.
3. **Validate before upload:** Check that every row has a non-empty **Agency** value, that employee counts per agency match HR records, and that the **PersonId** (email) format is correct.

4. **Upload and verify:** Upload via Viva Insights web app or M365 Admin Center. After processing (up to 7 days), verify on the Data Quality page (insights.cloud.microsoft → Admin → Organizational data → Data Quality tab) that the Agency attribute has 100% coverage.

5. **Automate if possible:** Use the API-based import or Azure blob import for automated monthly uploads with failure alerting.

Data Refresh Failure Alerting (Path A):

If a monthly org data upload fails or the Agency attribute is missing for new employees, those employees silently disappear from all partitions. Nobody gets alerted.

Mitigations:

- After each upload, check the **Data Quality** page in Viva Insights Admin to verify attribute coverage.
- Set a calendar reminder to verify Agency attribute has 100% coverage within 7 days of each upload.
- Consider automating uploads via the Viva Insights API-based import or Azure blob import for more reliable cadence.

6.2 Path B: Entra ID Domain (No CSV)

Data Type	Source	Refresh Ca
Domain (agency identifier)	Primary SMTP address (system-generated)	Automatic
Employee hierarchy (ManagerId)	Entra ID (enable via Configure Entra connection)	Automatic
Department (Organization)	Entra ID Department field (enable via Configure Entra connection)	Automatic
Copilot usage data	Automatic from M365 signals	Daily (6-da

Key advantage: No ongoing data maintenance. New employees automatically appear in the correct partition based on their SMTP domain. Departing employees are automatically removed when their account is disabled.

Path B Limitation: You cannot filter by custom attributes (Cost Centre, Job Function, Location, etc.) within agency partitions. If you need these filters, upload a CSV using the parallel data ingestion method — Entra continues providing ManagerId and Organization while the CSV adds custom attributes.

6.3 Upgrading from Path B to Path A

Organisations can start with Path B for rapid deployment and later add a CSV upload to unlock richer analytics:

- 1. Enable **parallel data ingestion** in Viva Insights → Organizational data → Configure Entra connection.
- 2. Keep Entra as the source for `ManagerId` and `Organization` .
- 3. Upload a CSV with additional attributes (`Agency` , `FunctionType` , `Location` , etc.).
- 4. Update partition filters from `Domain` to `Agency` if preferred (edit each partition → change filter condition).

7. Access Control Matrix

Role	Copilot Dashboard	Partition Access
Global / Insights Admin	✔ Full ("Your company")	✔ Manage all partitions (Requires Analyst role on Global)
Insights Analyst (Agency A)	✘ Not enabled	✔ Agency A partition only
Agency A CEO / VP	✘ Not enabled	✘ No direct access

Role & Partition Interaction Scenarios

In a multi-agency environment, the combination of **roles** and **partition assignments** determines what each user can actually do. This is the most common source of confusion during implementation.

Scenario	Roles Assigned	Partition Assignment
Central IT Admin (configure only)	Insights Admin	None needed
Central IT Admin + Analyst	Insights Admin + Insights Analyst	Global partition
Agency A Analyst	Insights Analyst	Agency A partition
Agency A Analyst mistakenly on Global partition	Insights Analyst	Global + Agency A partition
AI Admin managing VFAM	AI Admin	N/A
Full access (Central IT only)	AI Admin + Insights Admin + Insights Analyst	Global partition

Critical Rule: Never assign an agency analyst to the **Global partition**. Global partition grants automatic Copilot Dashboard access and tenant-wide query access — defeating the entire isolation architecture. Always verify partition assignments after adding new analysts: `insights.cloud.microsoft` → Admin → Privacy settings → Partitions → select each partition → verify the Analysts tab.

8. Governance & Ongoing Operations

- **Monthly (Path A only):** Upload updated organizational data CSV (Central IT). Path B requires no recurring data maintenance.
- **Monthly:** Refresh Copilot PBI template queries and publish reports (Agency Analysts).
- **Quarterly:** Audit dashboard access list and partition memberships.
- **Onboarding:** To add a new agency: **Path A** — add them to the CSV, create a new partition, assign an analyst. **Path B** — create a partition filtered by the new agency’s domain, assign an analyst. Both paths: spin up a new PBI workspace or use Publish Reports.

Day 2 Operations Runbook

Scenario	Who	Action
Employee transfers from Agency A to Agency B	Central IT	Path A: Update Agency attribute in Path B: Change the employee’s prim
New agency created	Central IT + Insights Admin	Path A: Add agency to CSV → create Path B: Create partition filtered by n Both: create PBI workspace or use P
Agency merged or retired	Insights Admin	Update Agency attribute for merge
Agency analyst leaves	Insights Admin	Remove from partition → assign repl
AutoCxo accidentally re-enabled	Central IT	Verify in Admin Center → Settings →
New hire not appearing in any partition	Central IT	Path A: Check if the employee has tl Path B: Verify the employee’s primar

9. Risk Register

Risk	Impact	Mitigation
Auto-enablement policy is accidentally re-enabled	High	Document the policy; set quarterly audit
Partition filter misconfigured, includes wrong agency	High	Validate filtered employee count during
Power BI workspace permissions grant cross-agency access	High	Use dedicated workspaces per agency
Copilot Metrics Export enabled — user-level data downloadable	High	Disable CopilotMetricsReport VFAM control
Agent Dashboard exposes cross-agency agent usage	Medium	Disable AgentDashboard VFAM control
Analytics Reports auto-available to global partition analysts	High	Ensure agency analysts are NOT assign
Org data upload fails — employees silently drop from partitions	Medium	Verify Agency attribute coverage after e
Analyst query results not transferable when analyst leaves	Low	Document this limitation. Re-run critica

10. Discovery Questions for Customer

1. **Does each agency have a distinct email domain, or do all agencies share one domain?** (Determines whether Path B — Domain-based isolation — is viable, or whether Path A — CSV with custom Agency attribute — is required. See Section 4.1).
2. **How is the Entra ID ManagerID hierarchy currently structured?** (Determines if CEOs are auto-identified as senior leaders).
3. **How many total employees per agency, and how many have Copilot licenses?** (Partitions need sufficient population to meet the minimum group size threshold, default 10).
4. **Are there shared-services teams (IT, Legal, Finance) that serve multiple agencies?** (Determines if a "Shared Services" partition is needed).
5. **What minimum privacy threshold (minimum group size) is acceptable?** (This is set tenant-wide; all agencies must agree on the number).
6. **Do agency leaders need Power BI Pro/Premium licences, or should we use Viva Insights Publish Reports?** (Determines report distribution method — Phase 4 options.)
7. **Has anyone already been granted Copilot Dashboard access or does any analyst have global partition access?** (Must audit and remediate before proceeding with Phase 1 lockdown.)
8. **Is there an automated HR data feed, or will org data uploads be manual CSV?** (Impacts reliability of partition boundaries over time.)
9. **Are Copilot agents deployed across agencies? If so, does agent usage data also need isolation?** (Determines whether Agent Dashboard needs VFAM lockdown.)

Appendix A: PowerShell Reference

Note: Most VFAM policies listed below can also be configured via the Admin UI: admin.microsoft.com → Settings → Microsoft Viva → Viva Insights → Turn Advanced Insights on or off. **Use the Admin UI for one-off changes.** Use PowerShell for scripted deployments, bulk operations, or when the Admin UI does not expose the control (e.g., CopilotMetricsReport).

```
# Install required module
Install-Module -Name ExchangeOnlineManagement -Force -AllowClobber
Connect-ExchangeOnline -UserPrincipalName admin@tenant.com

# Disable Auto-Enablement for Dashboard
Add-VivaModuleFeaturePolicy `
