

Copilot Analytics with Agency–Default Views for Multi–Agency Single Tenant

Version: 1.1 | **Author:** Sumit Sadhu | **Last validated:** 19 August 2026

THIS GUIDE’S AUTHOR–CREATED ARCHITECTURE PATTERN

Default Priority is an editorial name created by this guide. It is not a Microsoft product, security, compliance, sovereignty, or licensing term. The companion **Restricted Reporting** pattern was formerly labelled “Isolation”; the old word remains in the existing filename and URL only for link stability. Microsoft documents the component capabilities, but does not document either combined pattern as an end-to-end security boundary.

This pattern intentionally accepts that some authorized users can obtain broader cross–agency or tenant–wide views. Manager hierarchy can establish a useful default scope, but it is not an authorization boundary. Viva Insights partitions limit rows and columns in an assigned analyst query workspace; separate controls govern Dashboard, Analytics Reports, Agent Dashboard, metrics export, delegation, manager access, privileged roles, downloaded results, and Power BI. Neither pattern creates cryptographic, tenant, product–security, or independently certified isolation.

Pattern Boundary: Surface by Actor

Actor / surface	What controls it
Agency leader or manager — Copilot Dashboard / Analytics Reports	Access source plus manager hierarchy
Delegate — Dashboard, Agent Dashboard, and Copilot insights	Delegator eligibility and scope
Agency analyst — advanced query workspace	Insights Analyst role plus partition assignment
Global Administrator, globally assigned user, or global–partition analyst	Privileged assignment and least–privilege govern
Leader or analyst — Agent Dashboard / metrics export	Separate eligibility and feature/access policy
Power BI Viewer, Member, Contributor, or app audience	Workspace/app role, sharing, Build/export setti

Supported–environment and licensing gate:

Supported Microsoft 365 environments for Viva Insights features (30 June 2026) says GCC does not support Agent Dashboard, Copilot metrics export, or Copilot Power BI reports. Connect to the Agent Dashboard (30 July 2026) says Agent Dashboard is unavailable in national and regional clouds. Plan–level support does not establish

feature parity. Verify the exact cloud, tenant UI, Message Center, assigned service plans, agent activity, and every required surface before design.

Microsoft pages describe the advanced-access threshold differently. Environment requirements for Viva Insights (12 May 2026) explicitly gives **30 Microsoft 365 Copilot + 20 Viva Insights** as 50 assigned Viva Insights service plans; the Dashboard article (18 August 2026) describes 50 Copilot or 50 Viva Insights. Do not state that mixed assignments fail. Verify assigned plans and tenant availability. For Agent Dashboard, use the conservative feature-specific prerequisite of **50 Microsoft Copilot licences plus agent activity**; a 50-Viva-Insights-only tenant must validate availability. Escalate a documented mismatch to Microsoft Support.

Organizational-data precedence gate:

An upload does not universally or permanently replace Entra. Uploaded values change the source for supplied dashboard attributes; parallel ingestion can keep or restore Entra for **ManagerId** and **Organization**; Microsoft 365 Profile precedence is separate. Before change, capture each required attribute, current source, owner, effective date, coverage, and target surface in Data Quality and Profile. Check **Setup → Migration and imports**, Message Center, and the actual tenant UI. Use Organizational Data in Microsoft 365 for new/edited uploads unless the tenant explicitly presents a supported legacy path. Use supported update/delete behavior, not dummy rows. Source basis: Use your organizational data in Microsoft 365 and Microsoft Viva (2 December 2025), Upload and maintain data through the Microsoft 365 admin center (13 August 2026), Use Microsoft Entra plus .csv files for parallel data uploads (30 June 2025), Import and manage your organizational data with a .csv file (29 July 2026), Import organizational data from Workday (6 April 2026; 100,000-user limit), and Import organizational data using API-based import (preview) (6 April 2026).

Mandatory Negative Tests, Evidence, and Release Veto

1. Test agency leader, cross-agency manager, shared executive, delegate, agency analyst, multi-partition analyst, global-partition analyst, Power BI Viewer and Member/Contributor, AI Administrator, Insights Administrator, Insights Analyst, and Global Administrator accounts.
2. Test Copilot Dashboard, Analytics Reports, Agent Dashboard, weekly/daily metrics export, advanced query workspace, query-result download, delegation, manager-published reports, Power BI workspace/app, report export, Analyze in Excel, subscriptions, and resharing.
3. Capture test date, tester identity/role, group and partition memberships, policy/access export, org-data snapshot, expected result, observed result, screenshot or audit record, Power BI permissions, owner, and remediation ticket.
4. **Any failed or unexecutable negative test vetoes publication and go-live.** Restore the pre-change state or remove access, preserve evidence, and open Microsoft Support when documented and observed behavior differ.
5. Obtain written Security, Compliance/Legal, Privacy/DPO, Viva Insights owner, and Power BI owner sign-off on accepted visibility and residual risk. Repeat the suite quarterly and after any hierarchy, role, delegation, org-

data, partition, VFAM, licence, cloud, preview-status, or sharing change.

Rollback/change control: before change, export or capture VFAM policies, access lists, role assignments, delegations, hierarchy, partition filters/analysts, organizational-data source/quality, query assets, and Power BI permissions. Define owner, maintenance window, approvers, success/failure criteria, and restoration order. Enabling partitions is a high-impact tenant change; turning partitions off requires Microsoft Support. Export query assets before enabling and confirm deletion impact before removing any partition.

Which Guide Do I Need?

There are **two author-created reporting-pattern guides**. Choose based on your accepted visibility and tested controls:

► You are here

Default-Priority (Open)

Agencies see their own data by default; cross-agency visibility is acceptable

Go to

Restricted Reporting Pattern

Defense-in-depth reporting segmentation; legacy URL retained

Dimension	This Guide (Default Priority)
Core posture	Open — agencies default to their own data but authorized users may see aggregate tenant data
VFAM features	AutoCxO and delegation enabled for approved users; Agent Dashboard only where preview eligibi
Copilot Dashboard	Available to approved agency leaders; expected starting scope is hierarchy-derived and must be
Partitions	Optional — for row/column-scoped analyst query workspaces
Complexity & time	Low — hours to configure
Typical use	Organizations that explicitly accept broader authorized visibility

Decision shortcut:

If the requirement is “we want to see *our* data first and accept broader authorized views,” use this pattern. If broader reporting access is unacceptable, evaluate Restricted Reporting and its mandatory evidence gate. If the requirement is cryptographic, tenant, sovereign, or independently certified security isolation, neither guide establishes it; obtain a security architecture assessment.

TL;DR — Agency-Default Views in Under a Day

- Leverage native Copilot Dashboard scoping and delegation so each agency leader sees their own data by default — no lockdowns, no partitions required.
- 1. **Verify manager hierarchy** — ensure each agency CEO is the top-level manager for their agency in Entra ID (Section 4.1)
 - 2. **Enable AutoCxO & Delegation** — agency CEOs auto-identified, then delegate down to VPs (Phase 1)
 - 3. **Enrich org data** (optional) — CSV or Entra attributes for department/location filtering within each agency view (Section 4.2)
 - 4. **Configure Publish Reports** — enable manager settings so filtered reports reach agency leaders automatically (Phase 3)
 - 5. **Create partitions** (optional) — for analysts who need focused query access within a single agency (Phase 4)
- Time estimate: 2–4 hours for core setup (Phases 0–2). Add half a day if using partitions or CSV enrichment.

Prerequisites & Licensing

1. Executive Summary

This document provides an author-created reporting pattern for a **single Microsoft 365 tenant** that hosts **multiple agencies**, where each agency wants to see its own Copilot adoption and impact data **by default** and explicitly accepts broader authorized cross-agency or tenant-wide visibility.

Key Difference from Restricted Reporting:

Restricted Reporting applies group-scoped restrictions and partitioned analyst workspaces to reduce cross-agency reporting paths. This guide keeps eligible native features available because broader authorized visibility is accepted. Hierarchy provides a default view, not a security boundary.

Recommended Approach: Native Scoping + Optional Partitions

1. **Copilot Dashboard with “Your group” default** — agency leaders auto-identified; see their own hierarchy/s data by default.
2. **Dashboard Delegation** — CEOs delegate down to VPs and directors for cascading agency-scoped views.
3. **Publish Reports** — filtered by manager hierarchy for automatic agency-scoped delivery.
4. **Partitions (optional)** — for analyst-level deep dives scoped to a single agency; analysts may access multiple partitions if collaboration requires it.

2. Business Context & Requirements

2.1 Organizational Structure

2.2 Functional Requirements

ID	Requirement
FR-01	Agency leaders see their own agency's Copilot data by default when opening the dashboard
FR-02	Agency leaders can delegate dashboard views to their direct reports
FR-03	Each agency CEO gets adoption, impact, and sentiment metrics for their agency
FR-04	Central IT retains tenant-wide visibility for licence management and governance
FR-05	Agency-level analysts can run custom Copilot queries scoped to their agency
FR-06	Cross-agency aggregate visibility (e.g., "Your company" toggle) is acceptable if available
FR-07	CIO / Secretary-General gets a consolidated cross-agency view comparing adoption, impact, and ROI across a

Key distinction from Restricted Reporting:

FR-06 explicitly accepts broader authorized visibility. The companion pattern instead treats cross-agency reporting access as a risk to reduce and test surface by surface; it still does not constitute tenant or security isolation.

3. Solution Options Assessment

Option	Description
1. Dashboard + AutoCxO + Delegation	Enable native features. CEOs auto-get "Your group" as their c
2. Option 1 + Partitions for Analysts	Add partitions for analyst-level scoped queries alongside na
3. Restricted Reporting (Partitions + Surface Controls)	Restrict direct agency access to selected native surfaces and

4. Recommended Architecture

How “Your Group” Scoping Works

The Copilot Dashboard identifies senior leaders using the Entra ID manager hierarchy (Auto CxO Identification). **Automatic** identification applies only to tenants with **at least 2,500 Entra ID users** and a majority single reporting line; within that, a separate agency’s top leader is auto-identified only if that agency tree is **at least 4% of the total tenant**. Smaller tenants or sub-4% agencies must grant the CEO access manually — the “Your group” scope still works once access is granted. Leaders with access see two scopes:

Scope	What It Shows	Default?
“Your group”	Copilot data for all employees in the leader’s management chain	Yes — lands on this scope by default
“Your company”	Tenant-wide Copilot data across all agencies	No — available via toggle, but not the default

When each agency CEO is the top of their hierarchy, **“Your group” = their entire agency**. The dashboard opens to this view by default, immediately satisfying the “see my agency data first” requirement without any lockdown.

What about “Your company”?

Agency leaders with a tenant-wide access source may be able to use “Your company” and see aggregate data

across agencies. This pattern explicitly accepts that possibility (FR-06). If it is not acceptable, evaluate Restricted Reporting and its evidence gate.

4.1 Manager Hierarchy Setup

The entire default-priority architecture depends on a clean manager hierarchy in Entra ID. Each agency must form a self-contained tree.

Hierarchy Requirements

Requirement	Why It Matters
Each agency CEO has no manager set in Entra, or reports to a tenant-level admin outside all agencies	If CEO-A reports
All agency employees have a manager chain that terminates at their agency CEO	Broken chains (
Shared-services staff report through a clear chain	If shared service

CORRECT:

Two independent trees =
"Your group" = Agency only

INCORRECT:

CEO-B reports to CEO-A =
CEO-A's "Your group" includes
ALL of Agency B. Not desired.

Common Pitfall: In some shared tenants, a "super admin" or "Secretary General" is set as the manager of all agency CEOs. This creates a single tree where that person's "Your group" covers the entire tenant. **Solution:** Leave the **Manager** field blank for all agency CEOs, or have them all report to a shared-services administrative account that is not a real user (and therefore will not access the dashboard).

4.2 Enrich with Organizational Data (Optional)

Org data enrichment adds **filter dimensions** within the dashboard and analytics views. This is not required for agency-default scoping (the hierarchy handles that), but enhances the analytics experience.

Enrichment Method	What It Adds
Entra ID Attributes (zero effort)	Organization (Department), ManagerId , Domain , TimeZone
CSV Org Data Upload	Custom attributes: Agency , FunctionType , Location , LevelD
HRIS Connectors (SAP SuccessFactors, Workday)	Same attributes as CSV, pulled directly from source HRIS. Auto-syn
API-Based Import (Preview)	Same attributes as CSV, pushed programmatically via REST API.

Key difference from Restricted Reporting: In the companion pattern, an organizational-data attribute scopes rows and columns in each agency analyst query workspace. Here, organizational data primarily enriches analytics, while manager hierarchy influences the expected Dashboard starting view. Neither mechanism governs every surface.

5. Implementation Runbook

0 Phase 0: Pre-Flight Verification

Audit the current state before configuring anything.

- **Verify manager hierarchy:** Confirm each agency CEO has no cross-agency manager relationship. Use Entra portal → Users → select each CEO → check Manager field. Run the PowerShell audit in Appendix A for bulk verification.
- **Confirm assigned service plans:** Apply the conflict-safe licensing gate in Pattern Boundary & Release Gates. Verify feature presence after processing; do not infer failure from a mixed licence assignment.
- **Confirm supported environment:** Record the exact cloud and verify Dashboard, Agent, export, Power BI templates, and organizational-data path in the tenant UI and Message Center.
- **Identify agency leaders:** List each agency's CEO and their direct reports (VPs). These will be the primary dashboard consumers and delegation targets.
- **Review current VFAM state:** Microsoft 365 admin center → Settings → Microsoft Viva → Viva Insights → Turn Advanced Insights on or off. Document which features are currently enabled or disabled.
- **Check existing dashboard access:** Microsoft 365 admin center → Settings → Microsoft Viva → Viva Insights → Manage access settings for Microsoft Copilot Dashboard. Note who currently has access.
- **Capture rollback baseline:** Export policies, access, delegations, role/partition assignments, org-data source/quality, query assets, and Power BI permissions before change.

1 Phase 1: Enable Native Features

Enable only the eligible Dashboard features approved for this accepted-visibility posture. Agent Dashboard and metrics export require separate preview, cloud, privacy, and access decisions.

1.1 — Enable Auto CxO Identification

Microsoft 365 admin center → Settings → Microsoft Viva → Viva Insights → Turn Advanced Insights on or off → **Auto CxO Identification** → ensure set to **On** for **Everyone** (or verify no disable policy exists).

This automatically identifies agency CEOs (and other senior leaders) based on the Entra ID hierarchy and grants them Copilot Dashboard access with the “Your group” scope.

1.2 — Enable Dashboard Delegation

Same page → **Copilot Dashboard Delegation** → ensure set to **On** for **Everyone**.

This allows agency CEOs to delegate their dashboard view to their direct reports (VPs, directors). Delegates see the same scope as their delegator — the agency’s data.

1.3 — Enable Agent Dashboard

Only if the environment and tenant pass the gate: Agent Dashboard is preview. Treat 50 Microsoft Copilot licences plus agent activity as the conservative prerequisite, validate availability in Worldwide, and do not expect it in national or regional clouds. Scope access to the approved population; do not default to Everyone without a documented cross-agency agent-data decision.

1.4 — Metrics Export (optional)

Copilot metrics export is preview and is not partition-scoped. It requires separate eligibility/global-access validation and is unavailable in GCC. Enable only for an approved group after privacy review and negative testing of weekly/daily exports; otherwise disable `CopilotMetricsReport` and use governed reports.

After Phase 1 — Verification:

1. Wait 1–2 hours for AutoCxO to process.
2. Check **Manage access settings for Microsoft Copilot Dashboard** — agency CEOs should appear in the list as auto-identified.
3. Have an agency CEO navigate to `insights.cloud.microsoft` and confirm they see the Copilot Dashboard with “Your group” as the default scope.

4. Confirm the "Your group" employee count is in the expected range — note it reflects **Copilot-licensed** employees only, and groups below the minimum group size (default 10) show "--", so it tracks licensed headcount, not raw agency headcount.

2 Phase 2: Configure Delegation & Manager Settings

Set up the delegation chain so agency leaders can share their dashboard view with their teams.

2.1 — Agency CEO Delegates to VPs

Each agency CEO should:

1. Navigate to `insights.cloud.microsoft` → Copilot Dashboard.
2. Select the **Share** or **Delegate** option (top-right corner of the dashboard).
3. Add their direct reports (VPs, directors) as delegates.
4. Delegates will receive access and see the same agency-scoped view (“Your group” inheriting the CEO’s scope).

2.2 — Enable Manager Settings for Publish Reports

Navigate to `insights.cloud.microsoft` → **Admin** → **Manager settings**.

- Enable managers to receive published reports.
- Set the minimum team size threshold (this is the same tenant-wide privacy setting).
- Agency CEOs with team sizes above the threshold will be eligible to receive published reports filtered to their hierarchy.

2.3 — Enrich Organizational Data (Optional)

- Navigate to Viva Insights → Organizational data → **Configure Entra connection** → enable `ManagerId` and `Organization` checkboxes → Save.
- If you need custom attributes, first record current source precedence and confirm the tenant-supported upload path; then prepare the data per Appendix B. Uploaded attributes enrich filters but do not govern all access surfaces.

After Phase 2 — Verification:

1. Have a VP who was delegated access navigate to the dashboard. Confirm they see their agency’s data.
2. If org data was uploaded, verify filters (Department, Location, etc.) appear on the dashboard.

3 Phase 3: Publish Reports

Use Viva Insights Publish Reports to deliver curated analytics to agency leaders automatically.

3.1 — Run Copilot PBI Template Queries

- Insights analysts (Central IT or agency-level) navigate to `insights.cloud.microsoft` → Create analysis.
- Select a Copilot Power BI template (Copilot Adoption, Impact Explorer, Business Impact, etc.).
- Run the query. If partitions are enabled, run within the appropriate partition. If not, run against the global population.

3.2 — Publish with “Filter by Manager Hierarchy”

- After the query completes, select **Publish report**.
- Choose **“Filter report by manager hierarchy”**.
- Each enabled manager (CEO, VP) will receive a version of the report filtered to their team.
- Set an expiry date (up to 365 days) and republish monthly to keep data current.

Why this is eligible in Default Priority:

This pattern accepts tenant-wide visibility from documented access sources. Manager publishing is still a separate surface: pilot a shared executive and cross-agency manager, verify Dashboard and report scope, capture evidence, and roll back manager enablement if observed access exceeds the approved posture.

4 Phase 4: Partitions for Analyst Deep Dives (Optional — Mandatory for CIO Reporting)

If your organisation has designated analysts per agency who need to run custom queries, partitions provide row/column-scoped analyst workspaces. This phase is **optional for agency-level reporting** (dashboard views and published reports may suffice), but needed for the cross-agency query approach described for CIO reporting. A global partition is tenant-wide and requires explicit conflict-of-interest and least-privilege approval. See Section 6.2.

Before Enabling Partitions:

- (a) Understand that enabling partitions is **irreversible without contacting Microsoft support** and will delete all partition configurations if disabled.
- (b) **Export all existing query results** before enabling partitions.
- (c) Partitions are needed when analysts require row/column-scoped custom query workspaces. Dashboard and manager-published views may follow hierarchy, but their actual scope must be tested separately.

- Navigate to `insights.cloud.microsoft` → Admin → Privacy settings → Partitions → Enable Partitions.
- Create a partition per agency (e.g., “Agency A”), filtered by `Agency` attribute (CSV) or `Domain` (Entra).
- Assign agency analysts to their primary partition.
- **Cross-agency access:** Analysts may be assigned to multiple partitions only with a documented business purpose, conflict-of-interest review, expiry, and quarterly recertification.
- Assign Central IT analysts to the Global Partition for tenant-wide queries.

After Phase 4 — Verification:

1. Have an agency analyst sign in and confirm they see their agency’s partition in the partition switcher.
2. Run a test person query and verify the employee count matches the expected agency headcount.
3. If a cross-agency analyst exists, confirm they can switch between partitions they are assigned to.

6. Analytics Surfaces per Role

Default Priority can keep eligible analytics surfaces available to approved users. Availability, scope, preview status, cloud support, delegation, and export must be evaluated separately; hierarchy supplies a default dashboard view, not a universal access boundary.

Analytics Surface	Agency CEO / VP	Agency Analyst (with
Copilot Dashboard — “Your group”	✓ Default view = their agency	—
Copilot Dashboard — “Your company”	✓ Available via toggle (acceptable)	—
Copilot Analytics Reports (OOB)	✓ Via Dashboard access	✓ Via global or pa
Agent Dashboard	Preview; tenant-wide scope where eligible and approved	—
Publish Reports (manager-filtered)	✓ Filtered to their hierarchy	—
Custom Person Queries	—	✓ Scoped to assign
Power BI Templates	—	✓ Scoped to assign
Dashboard Delegation	✓ Can delegate to direct reports	—
Copilot Metrics Export	Preview; only if separately eligible, approved, and enabled	—

Compare with Restricted Reporting: The companion pattern restricts direct agency access to several surfaces and uses Power BI as the primary delivery path. Here, eligible surfaces may remain available because broader authorized visibility is accepted, but each surface still requires its own access decision and test.

6.1 ROI Analysis per Agency: Capabilities & Gaps

Agency leaders asking “What is Copilot’s ROI for *my* agency?” will find that some metrics scope naturally to their hierarchy and some do not. Set expectations upfront using the matrix below.

Which ROI Metrics Are Agency-Scoped?

ROI Metric	Scoped to “Your group” (Agency)?	Notes
Copilot Assisted Hours	✓ Yes	Impact page s
Copilot Assisted Value	✓ Yes	Calculated as
Adoption metrics (active users, usage intensity, consistent usage)	✓ Yes	Adoption page
Sentiment (Glint / Pulse / CSV survey)	✗ No — tenant-level only	Sentiment pag
Agent usage (Agent Dashboard)	✗ No — “Your company” only	Agent Dashbo
Licence cost data	✗ Not in dashboard	Licence costs

Limitation: Single Tenant-Wide Hourly Rate

Copilot Assisted Value is calculated as $\text{Assisted Hours} \times \text{Hourly Rate}$. The hourly rate defaults to **\$72/hour** and can be changed only in-session via the dashboard’s **Hours and value calculator**; the change is **not saved** and resets to the default each time the dashboard is reopened. It applies to **all employees across all agencies** — there is no way to persist or set different rates per agency, department, or role.

Impact: If Agency A’s average loaded labour rate is \$140/hr and Agency B’s is \$65/hr, the Assisted Value figure shown to both CEOs uses the same rate — making one agency’s ROI appear over- or under-stated.

Workaround: Use Power BI templates in partitions (Phase 4) to apply **agency-specific hourly rates in the Power BI calculation layer**. The raw Copilot Assisted Hours data flows into the PBI template; the analyst replaces the default rate with the agency’s actual loaded labour rate in a DAX measure or parameter. This produces accurate per-agency Assisted Value figures outside the dashboard.

Limitation: No Historical ROI Trending on the Dashboard

The Copilot Dashboard uses a **28-day rolling window** and provides **no before/after comparison or historical trendline**. Agency leaders who need to demonstrate ROI growth over quarters (e.g., “Agency B’s Copilot value grew from \$20K/month in Q1 to \$35K/month in Q3”) cannot do this from the dashboard alone.

Workaround — Recommended for ROI-focused agencies: Use Power BI templates within partitions (Phase 4). Run the Copilot Impact Explorer or Business Impact template **monthly**, each time capturing the month’s metrics. Publish each refresh as a new dataset snapshot in the agency’s Power BI workspace. Stack monthly snapshots in a summary report to build a quarter-over-quarter ROI trendline.

Implication: For agencies that need ROI trending, Phase 4 (partitions) is **not optional** — it becomes a required component of the architecture. Plan the partition and analyst setup accordingly.

Recommendation for ROI-Focused Multi-Agency Deployments

1. **Dashboard for real-time adoption & current-month ROI:** Agency CEOs use the Copilot Dashboard (“Your group”) for live adoption metrics and this month’s Assisted Hours/Value.

2. **Partitions + PBI for accurate, historical, agency-calibrated ROI:** Treat Phase 4 as mandatory. Analysts run monthly PBI template queries within their agency partition, apply agency-specific hourly rates, and build cumulative ROI reports.

3. **Billing Playbook for cost-side data:** Combine the Assisted Value from PBI reports with licence cost data from the Lifecycle & Billing Playbook to produce a net ROI figure per agency.

6.2 Cross-Agency Impact & Adoption Analysis (CIO View)

A CIO or Secretary-General sitting **above all agencies** needs a consolidated cross-agency view that the Copilot Dashboard does not natively provide. The dashboard shows either “Your group” (one agency) or “Your company” (blended tenant aggregate) — neither provides side-by-side agency comparison.

What the CIO Needs vs. What the Dashboard Provides

CIO Need	Dashboard Support
Cross-agency side-by-side comparison	✗ None
Feature adoption depth per agency	✗ None (per-app breakdown exists but not comparable)
Behavioral impact per agency (meeting time, focus time changes)	✗ None
Consolidated executive roll-up report	✗ None
Cross-agency benchmarking	✗ None

CIO Reporting Architecture

1. **Phase 4 (partitions) is mandatory for CIO reporting** — the global partition is the CIO’s primary data source. Without partitions, cross-agency comparison is impossible.

2. **Designate a Central IT analyst on the global partition** as the CIO’s primary reporting resource. This analyst runs queries across all employees, grouped by the

Agency

 org data attribute.

3. **Recommended PBI executive dashboard structure:**

○ **Page 1 — Agency Scorecard:** Ranked table of agencies by adoption %, Assisted Hours, and Assisted Value

○ **Page 2 — Feature Adoption Heatmap:** Agency × M365 App matrix showing per-app adoption intensity

○ **Page 3 — Behavioral Impact:** Before/after comparison of meeting time, focus time, email time per agency

○ **Page 4 — Trends:** Monthly adoption and Assisted Hours trendlines per agency (requires monthly query snapshots)

4. **Deliver via Power BI workspace** with CIO as Viewer. Refresh monthly.

Product Limitation: All CIO cross-agency views require a Central IT analyst to build custom PBI reports. The Copilot Dashboard itself has no “compare groups” or “segment by attribute” capability. This is a platform limitation, not a configuration gap.

7. Access Control Matrix

Role	Copilot Dashboard	Default Scope
Global Administrator	✔ “Your company” access	“Your company”
Insights Administrator	Not granted by this role alone	—
AI Administrator	Must add or otherwise qualify itself; role alone is not a view grant	Depends on sepe
Agency CEO (auto-identified)	✔ Auto-granted	“Your group” = A
Agency VP (delegated by CEO)	✔ Via delegation	“Your group” = CE
Agency Analyst	✔ If on global partition; ✖ if agency partition only	—
Central IT Analyst	✔ Via global partition	“Your company”
CIO / Secretary-General	✔ Auto-granted (if top of hierarchy) or via delegation	“Your company”

Flexible but governed partition access: Default Priority permits multi-partition or global access when the approved role requires it. Every broad assignment still needs least-privilege justification, conflict-of-interest review, expiry, evidence, and quarterly recertification.

8. Governance & Ongoing Operations

Ongoing Tasks

Cadence	Task
Monthly	Refresh Copilot PBI template queries and republish reports
Monthly (if CSV)	Upload updated org data CSV
Quarterly	Audit manager hierarchy — verify agency CEOs are still top-of-tree and new hires have correct mana
Quarterly	Review dashboard access list — confirm auto-identified leaders match expected agency leadership
Quarterly	Repeat all actor/surface negative tests, recertify global and multi-partition access, and retain the evic
On change	When a new agency is added: verify CEO hierarchy, wait for AutoCxO identification, CEO delegates to

Day 2 Operations

Scenario	Who	Action
Employee transfers from Agency A to Agency B	HR / Central IT	Update the employee’s manager in Entra ID to a man
New agency created	Central IT	Ensure the new CEO has no cross-agency manager.
New agency CEO appointed	Central IT	Update Entra ID: set the new CEO as manager of all c
VP not seeing dashboard	Agency CEO	Check if the CEO has delegated access to the VP. If r
“Your group” count seems wrong	Central IT	Audit the Entra ID hierarchy. Common causes: (a) em

9. Risk Register

Risk
Manager hierarchy misconfigured — CEO-A's "Your group" includes Agency B employees
AutoCxO identifies unintended users as senior leaders
Agency leader toggles to "Your company" and sees data they find confusing (not sensitive, but unexpected)
Delegation chain extends too far — low-level managers get dashboard access
Org data CSV not maintained — custom filters become stale
Shared-services staff appear in an agency CEO's "Your group"
Agency later requires stronger reporting segmentation or a certified security boundary
Shared executive, cross-agency manager, global-partition analyst, or conflicted analyst receives broader access than sta
Power BI resharing, export, Build, Analyze in Excel, or workspace role bypasses intended audience

10. Discovery Questions for Customer

- 1. Which cross-agency and tenant-wide views are explicitly acceptable, by actor and surface?** If the requirement is tenant, cryptographic, sovereign, or certified security isolation, stop and obtain a security architecture assessment; Restricted Reporting is only defense-in-depth reporting segmentation.
- 2. How is the Entra ID manager hierarchy structured?** Does each agency CEO sit at the top of an independent tree, or is there a shared parent?
- 3. How many agencies, and how many employees per agency?** (Each agency needs enough employees to meet the minimum group size threshold for "Your group" to display data.)
- 4. Do agency CEOs want to delegate dashboard access to their VPs and directors?** (Determines whether to actively configure delegation in Phase 2.)
- 5. Are there shared-services teams?** Where should they appear — in an agency's "Your group," or only in the "Your company" view?
- 6. Do you need custom analytical filters (Department, Location, Job Function)?** (Determines whether to enrich with CSV org data.)
- 7. Will dedicated analysts per agency run custom queries?** (Determines whether to enable partitions in Phase 4.)
- 8. Are any shared executives, cross-agency managers, global-partition analysts, or analyst conflicts of interest present?** Record and test their expected access explicitly.

9. **What is the minimum privacy threshold (minimum group size) acceptable to all agencies?** (Tenant-wide setting — all agencies must agree.)
10. **Are Copilot agents deployed across agencies?** Agent Dashboard is preview, not partition-scoped, and unavailable in national/regional clouds. Confirm eligibility, approved audience, privacy posture, and tested scope before enabling it.
11. **What exact cloud and preview capabilities are supported?** Validate Agent Dashboard, metrics export, Copilot Power BI reports, and organizational-data paths against the current matrix and tenant UI.

# Find users with no manager set (potential tree breaks)
Get-MgUser -All -Property DisplayName,UserPrincipalName,Manager `
  -ExpandProperty Manager |
  Where-Object { $null -eq $_.Manager } |
  Select-Object DisplayName, UserPrincipalName |
  Format-Table -AutoSize
```

Appendix B: Organizational Data CSV Template

If using CSV org data for enrichment (not required for agency–default scoping):

```
EffectiveDate,PersonId,ManagerId,Organization,Agency,FunctionType,LevelDesignation,Location
2026-03-01,user1@tenant.com,ceo-a@tenant.com,Engineering,Agency A,Engineering,Director,Sydney
2026-03-01,user2@tenant.com,user1@tenant.com,Engineering,Agency A,Engineering,Manager,Melbourne
2026-03-01,ceo-a@tenant.com,,Executive,Agency A,Executive,CEO,Sydney
2026-03-01,user4@tenant.com,ceo-b@tenant.com,Operations,Agency B,Operations,Director,Brisbane
2026-03-01,ceo-b@tenant.com,,Executive,Agency B,Executive,CEO,Brisbane
```

Note: Unlike Restricted Reporting, where the **Agency** attribute can define a partitioned analyst query workspace, here it is used for analytics enrichment (for example, filtering reports by agency name). Dashboard default scope is driven by manager hierarchy; neither mechanism governs every surface.

Dated Microsoft source basis: Validated 19 August 2026 against Dashboard (18 August 2026), Agent Dashboard preview (30 July 2026), environment requirements (12 May 2026), supported environments (30 June 2026), dashboard settings (13 August 2026), roles (7 July 2026), delegation (9 February 2026), manager settings (23 July 2026), partitions (23 June 2025), privacy settings (20 November 2025), technical privacy (10 December 2025), and organizational–data sources dated 30 June 2025 through 13 August 2026. Verify current Learn, Message Center, Service Health, tenant UI, and Microsoft Support guidance before implementation.
